FinLogic

Monday, July 7, 2025

Good morning, my friends.

I hope you all had a truly fulfilling and joy-filled Independence Day holiday!

Whether it was the scent of barbecue lingering in the backyard, the gentle breeze by the lake brushing against your face, or the dazzling fireworks lighting up the night sky — I sincerely hope those little moments brought you pure relaxation and happiness.

For me, being able to slow down and spend quality time with family and friends, stepping away from the usual hustle — that, in itself, feels like such a gift.

Independence Day isn't just about celebrating freedom — it's also a perfect moment to pause, reflect, and recharge.

I hope you didn't just unplug your mind for a while, but also found new energy for the challenges ahead. Maybe it came from a casual conversation with friends that sparked a fresh idea, or during an early morning run when a new insight into the markets suddenly clicked.

Hi everyone, I'm your old friend and your trusted Quantitative Strategy Advisor — Lauren D. Miller.

The holiday mode is officially switched off, and it's time for us to dive back into July's markets with a recalibrated mindset and full momentum.

This month, we're not just here for the usual market fluctuations — we're looking for the real surprises that capital can deliver.

Those rare, bright opportunities that make you pause, look up, and say — this is it.

Much like the fireworks on Independence Day — we're not chasing scattered sparks, but aiming for a show that lights up the entire investment landscape.

We're ready to lean on cutting-edge Acumeta quantitative strategies to uncover signals hidden deep within the data and seize the fleeting moments where real opportunity emerges.

Let's channel the clarity and energy we gained over the holiday into decisive, confident execution in July's trading.

I truly believe that with renewed focus and sharp strategy, we have everything we need to create our own summer success story — together.

Barbecues, fireworks, and that shared spirit of freedom — I hope you all had your fill of those. But now, it's time to shift our attention back to the markets we care so much about.

Because while we were enjoying the holiday, some major developments quietly landed, and they're going to significantly influence this week's stock market movements — and even shape the direction of future trading adjustments.

The much-anticipated THE BIG BEAUTIFUL ACT has finally passed and come into effect. This isn't some minor piece of legislation — over the next decade, it will bring $4 trillion in tax cuts and reduce spending by at least $1.5 trillion. What does that mean for us? It's worth thinking about.

In addition, Elon Musk has announced the formation of the America Party, and publicly stated his goal to see lawmakers who supported THE BIG BEAUTIFUL ACT lose their seats in next year's midterm elections. This sounds like something straight out of a Hollywood movie, but in reality, it brings new layers of political uncertainty to our future trades.

And of course, the ongoing tariff ceiling negotiations — the unresolved issue that continues to hang over global trade. Will we see a repeat of the sharp market drop that took U.S. stocks by surprise back in April?

To all our long-time friends, welcome back. And to the new members joining us, I hope you stay engaged as we continue to share insights and interpretations of the markets through quantitative strategy.

If you want to learn more about our doctor and our Quantitative Think Tank Center, you can click here to visit the official secure website for a more comprehensive understanding. Please click: https://www.finlogichub.com.

Dr. Charles H. Sloan hopes to establish a quantitative think tank institution, build the Acumeta brand, upgrade quantitative trading

FinLogic

capabilities, and introduce AI reasoning and large-scale data comprehensive analysis in practice to create objective investment trading tools that can ultimately benefit investors worldwide.

For a long time to come, we will continue to validate and confirm Acumeta's practical effectiveness through comprehensive investment strategies including stock trading, options trading, cryptocurrency trading, and U.S. Treasury trading. At the same time, I also call on you to actively participate and witness the results.

The benefit of this is that by expanding participation in training the practical database, it helps optimize and improve the final investment performance of this quantitative system.

Our Quantitative Think Tank Center is dedicated to providing you with advanced knowledge on quantitative strategy and high-level investment trading. Of course, you're also welcome to actively engage, share your full opinions and feedback on our quantitative strategies — I'm always happy to explore these ideas together with you.

But beyond learning, you should also gain real trading benefits — because ultimately, this is about growing your wealth.

To provide safety and reliable investment insights, we've implemented a compensation-backed verified stock trading mechanism.

What exactly is compensation-backed verified stock trading?

It's simple — we provide you with a basic layer of protection. As long as you strictly follow the complete requirements of the quantitative strategies provided by Dr. Charles H. Sloan, and apply them to actual trading, you will receive a specified number of shares within a set time period. If those shares result in losses, we offer compensation.

This way, you can confidently participate in all future trading activities.

Up next, we will focus on sharing Dr. Charles H. Sloan's interpretation and in-depth analysis of these key influencing factors, along with some specific trading guidance for the current situation.

Additional notice: Dr. Charles H. Sloan will return here on Tuesday and fully take over the daily session sharing. By then, you can continue to stay in touch with me and keep deepening our friendship in quantitative investing.

Here are Dr. Charles H. Sloan's viewpoints:

The Impact of THE BIG BEAUTIFUL ACT:

Winners and Losers:

Chip manufacturers, traditional energy companies, airlines, and manufacturers that produce within the United States will all receive significant tax breaks and policy support, which could drive their stock prices higher. That means, in the long run, stocks in these sectors have clear growth potential, and the tech stocks we hold are already benefiting from this trend.

However, at the same time, certain subsidies for electric vehicle producers are being removed, logistics companies may lose tax exemptions on small parcels, and some healthcare and welfare programs could face challenges.

Tesla's significant drop at the market open today clearly reflects this negative impact.

Fiscal Deficit and Inflation: U.S. National Debt Approaching $40 Trillion

The massive spending under this Act will further expand the U.S. federal deficit, which could push Treasury yields higher and increase inflation expectations.

If inflationary pressures persist, the Federal Reserve will likely become even more cautious about cutting interest rates — and that could weigh on growth-oriented tech stocks, especially those tied to blockchain innovation.

We already saw a short-term dip in these stocks on Monday, mainly driven by emotional sell-offs rather than fundamental risks.

But this kind of short-lived pullback isn't a deeper market threat — in fact, it's a chance to buy quality assets at better prices.

Why do I say that?

Because the inevitable expansion of U.S. Treasury issuance can only happen under a lower interest rate environment to ensure affordable financing and borrowing costs.

At the simplest level, U.S. Treasuries are the government's way of borrowing money — backed by America's reputation and legal credibility — in exchange for fixed interest payments. Each Treasury bond is essentially a formal loan certificate.

Since new U.S. Treasury issuance is only favorable in a low-interest-rate environment, a Fed rate cut is inevitable!

So, why won't we see a rate cut in July?

In last Thursday's analysis, I already shared my core view on this, but I want to expand on that today: The ongoing economic growth and declining unemployment rate are giving the Federal Reserve more time to evaluate their policy decisions.

That's exactly why this month's CPI report is especially critical.

We all know the Fed is focused on controlling inflation — but they also want to see steady economic growth, fewer layoffs, and more jobs created.

However, the lasting effects of current tariff policies are driving up long-term inflation pressures, which is delaying the Fed's decision to cut rates.

Why do I believe that we'll see a rate cut in September?

One of the key reasons is the Non-Farm Payroll data — and the evolving tariff situation also plays a role.

Looking back to last Thursday, right before the official jobs report, the ADP numbers showed a decline in private-sector hiring. Yet, the Non-Farm Payroll data still came in with an increase.

What does that tell us? It reflects job growth primarily within the public sector, including a rebound in federal employment after layoffs within the Department of Government Efficiency came to an end.

In reality, this points to deeper, hidden risks of economic slowdown or even stagflation.

That's exactly why I believe the Non-Farm Payroll report for July won't reflect overly strong expectations for economic growth.

On another note, the new tariff policy originally scheduled for April was delayed to July 9th, and its enforcement has been postponed again to August 1st.

What does that timing signal?

No matter how the negotiations play out, this delay has effectively given global suppliers and buyers over three months to complete shipments and fulfill orders ahead of the tariff implementation.

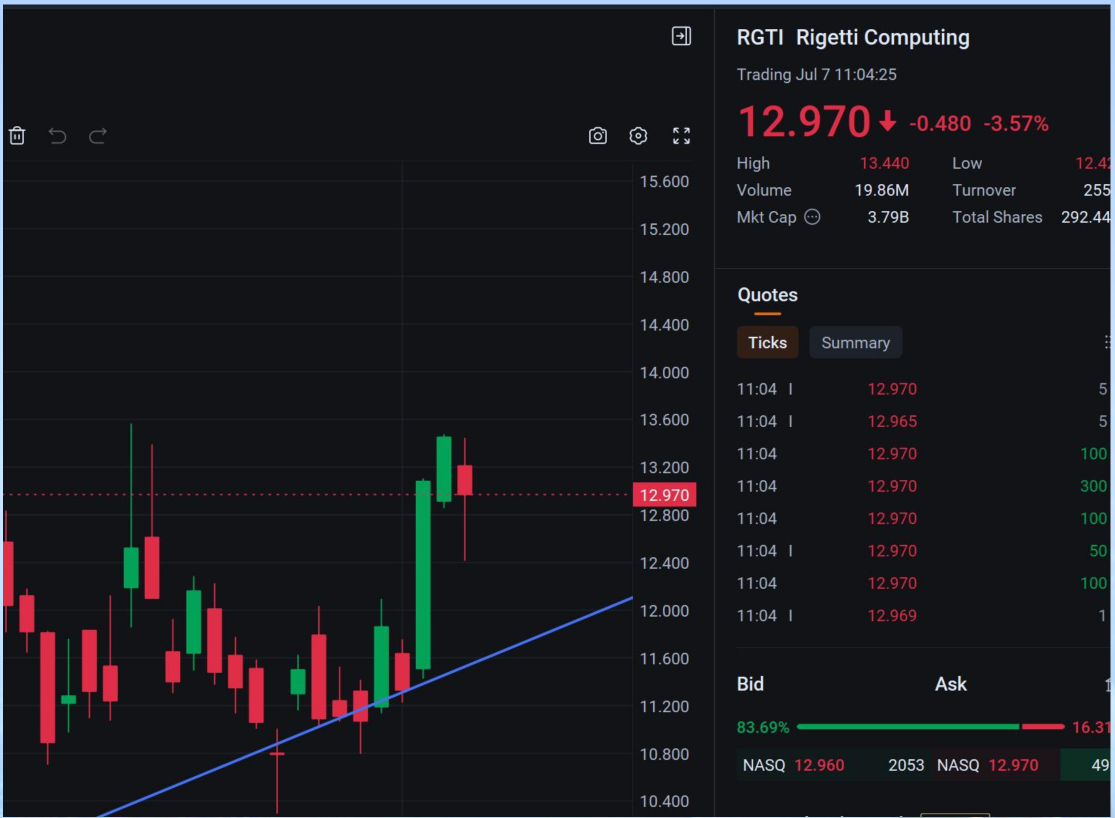
Those deliveries, of course, aren't affected by the updated tariff rules — which means in the short term, we are unlikely to see significant inflationary pressure in the U.S.

And that is exactly one of the subtle but crucial reasons I remain optimistic about the likelihood of a rate cut in September.

So holding some stocks in the blockchain space won't be negatively impacted—in fact, it's a continued buying opportunity!

Certain tech stocks are benefiting from the tax breaks in the Big Beautiful Act. For example, after a steady rise, RGTI saw a slight pullback today, which actually signals another chance to buy ahead of the next upswing.

In last week's trading progress, your compensation-backed validation method remained effective.



Meanwhile, HOOD continues to offer you opportunities to participate. This crypto trading platform is riding the wave of stock tokenization, with its future valuation poised to grow significantly—potentially reaching the hundreds of billions.

These trading targets highlighted Monday's new winners, and community members who have already joined are now enjoying well-deserved profits!

An even more important hedge trade to keep your eye on: UVXY and UVIX.

After consolidating at lower levels last week, both finally delivered visible hedge performance on Monday. As market fears around the looming tariff deadline and broader uncertainty spread again, these volatility indexes pushed higher — boosting ETF returns in the process.

This type of risk-hedge strategy works especially well in the lead-up to major data releases or policy shifts.

And when the volatility index is hovering near historical lows, building short-term hedges like this aligns perfectly with tactical trading logic.

If you followed my recommendation last week and entered this trade, I suggest continuing to hold for now — aiming for a target exit once we see gains exceed 5%.

Remember, the goal of hedging is to protect your portfolio from sharp market downturns or panic-driven selloffs. This isn't a long-term profit strategy — it's designed for short-term application only!

The Nasdaq just hit its fourth record-high close of the year.

Many market indicators are flashing signs of overheating — and we've officially entered that familiar tug-of-war moment between sellers locking in profits and new buyers chasing momentum.

In the short term, there's still room for the market to grind higher — we could easily see the Nasdaq stretch toward 20,800 to 21,000, and the S&P 500 toward 6,500.

But let's be honest — that upside doesn't justify the level of risk we're facing right now. For us, it's time to shift fully into defense mode.

Looking at recent performance, the Dow Jones has been particularly resilient, gaining 2.3% over the past week.

Following last week's stronger-than-expected jobs report, the broader market surged to new all-time highs, and naturally, there's growing speculation the Dow could keep pushing higher.

We'll be watching closely — and if we see those new highs materialize, it'll be a perfect window for us to start trimming some equity positions.

THE BIG BEAUTIFUL ACT

On the surface, it's a tax cut. But let's be honest — it's wealth redistribution disguised as policy, and not in a way that helps the people who need it most. Beneath the headlines, this act delivers a sharp blow to the clean energy transition. Subsidies for electric vehicles? Gone. Just like that, Tesla's $1.2 billion a year in government support has vanished overnight.

Meanwhile, funds slashed from social programs have been quietly redirected to support traditional energy and military spending.

Unsurprisingly, Musk wasn't having it — he fired off 23 back-to-back tweets slamming the bill as “a recipe for national bankruptcy” and warning of “debt slavery.” And in true Elon fashion, he's launched the America Party, aiming to disrupt Congress and break the two-party gridlock.

Musk is ready to throw $20 billion behind this political project — but the markets clearly aren't impressed. Tesla's stock plunging in pre-market trading says it all.

At the same time, Trump has played his next card in this high-stakes game: a wave of 12 global tariff ultimatums, with rates starting at 10% and topping out at 70%, squarely targeting China, India, and other BRICS-friendly nations. His message? Take it or leave it.

But here's the strange part — markets are unusually calm. Just back in April, the mere threat of tariffs sent stocks tumbling. But today? The S&P is hitting fresh highs, and the VIX, Wall Street's fear index, barely budges.

Why? Because Wall Street has been betting on what insiders are calling the TACO trade — Trump Always Chickens Out.

But I wouldn't be so sure this time. Trump's poll numbers are slipping, key swing states are in play, and he's desperate to revive his “tough guy” image. Tariffs are his political gamble that could define his campaign. The delay is until August 1st? Just buying time. The real tariff shockwave hasn't even landed yet.

I'll be back tomorrow with a complete breakdown of this week's trade roadmap. Stay tuned — we have a lot to navigate together.

A heartfelt thank you to Dr. Charles H. Sloan for always keeping our community group in mind, even amidst his busy schedule, and for providing cutting-edge market insights and daily trade guidance.

It's truly been an honor to step in and lead our daily community sessions on behalf of Dr. Charles H. Sloan these past few weeks.

But as we all know, July often signals change — a time for new directions and new momentum.

After all, admiration for legacy and respect for leadership have always been woven into the fabric of America's spirit.

I'm looking forward to welcoming Dr. Charles H. Sloan back officially this Tuesday!

As shown in the chart, his upcoming series of sessions will give us the opportunity to systematically dive into essential quantitative knowledge and strategies.

I'll gladly continue supporting the group as a teaching assistant — and extend a warm welcome to all our new members joining the community!

And don't forget — our token vouchers are being distributed. Reach out to me directly, and I'll walk you through the simple tasks to claim yours.

That wraps up our Monday morning update. See you all again this afternoon. Take care, my friends!

Dear friends, I'm Lauren D. Miller — welcome back to our Quantitative Strategy Community.

The July sunshine is lighting up our little quant community, just like fireworks illuminate the sky on Independence Day — warm, bright, and full of hope.

This space we've built together is more than just data colliding — it's where dreams intersect.

Every time we test a strategy, every result we achieve, we're writing our own story — from the ups and downs of candlestick charts to the growth of real wealth. With wisdom and conviction, we've earned not just market returns, but mutual trust and respect.

When we sit together and share, it's never just about strategies — it's about our shared belief in the future.

And those token vouchers? They're not just lines of code. They're symbols of connection — tangible proof of our friendship, our passion, and the heartbeat behind everything we do.

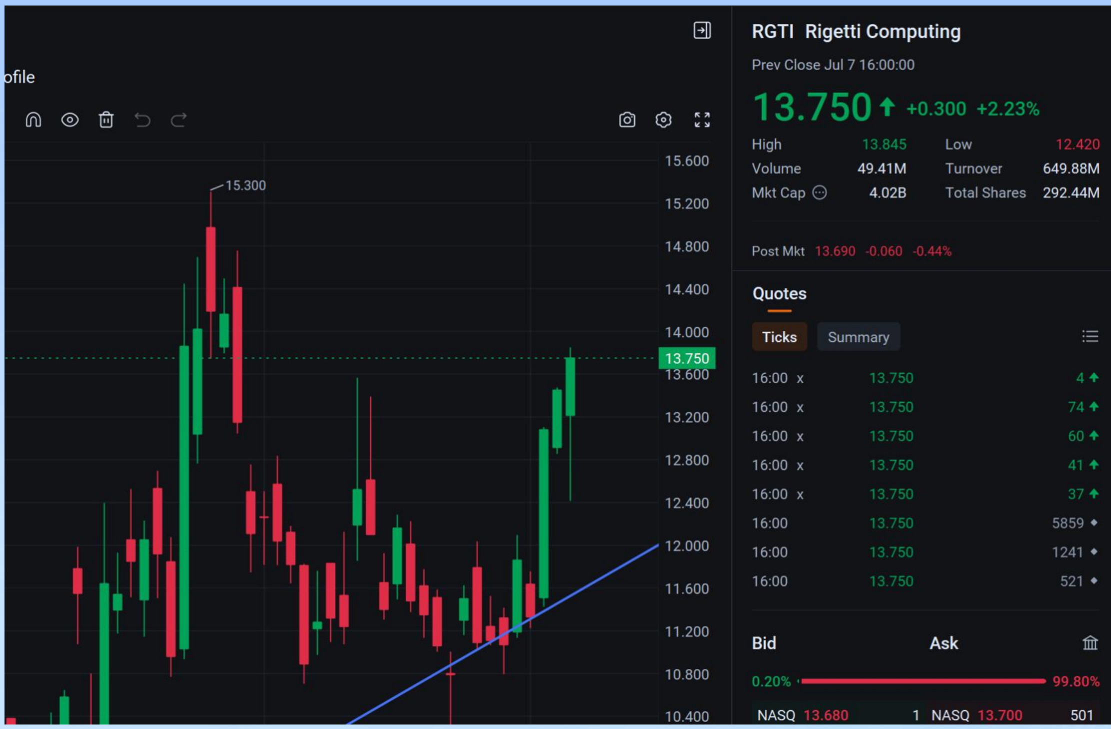
In a way, they're like a check sent from the future — carrying our hopes for wealth creation, and serving as a witness to the promises we've made to each other.

In this fast-paced world, we choose to slow down — to read the data with care, to connect with trust, and to look toward the future together.

This journey is just beginning, and every step is full of possibilities. I can't wait to see what we'll create together — with every bit of effort, we'll fulfill the promise of growth, and write a success story

FinLogic

that truly belongs to us.



Compensation-backed Stock Trading Validation — Progress Update:

Let's take a moment to check in on the two key stocks we've been validating through our compensation-backed plan over the past week — RGTI and HOOD, along with their hedge instruments: UVXY and UVIX.

Looking at this morning's market open, both stocks have successfully delivered profits, though the current profit scale remains relatively modest.

That's entirely expected, given the nature of the compensation-backed validation approach you've adopted. After all, this is about validation — and the results clearly reflect that our

Acumeta system provides accurate, reliable, and highly efficient value.

So once again, congratulations to every community member who followed the trading participation requirements. I'm officially announcing that your validation process has reached an important milestone of success.

Although the compensation-backed mechanism will no longer be triggered this time, we will continue to recognize your contributions. Your efforts will be rewarded with tokens issued by the Quantitative Think Tank Center.

Whether you were holding options or the underlying stocks, you've achieved real profits — and this is just the beginning.

Acumeta Drawdown Verification Details

Symbol	Profit	Drawdown Description	Dra vdown Trigger Time	Verification Conclusion
PDD	Profit	Sell-Off Prompt	July 4	Success
CLSK	Profit	Sell-Off Prompt	July 11	Success
IWY/PFF	Profit	Cash cow, dividend distribution	Short-Term	Success
IBIT	Profit	Stock/option buying	Short-Term	Success
UPST	Profit	Stock/option buying	Mid-Term	Success
RDDT	Profit	Stock/option buying	Short-Term	Success
HUT	Profit	Stock/option buying	Short-Term	Success

Why doesn't our compensation-backed verification plan promise specific profit targets?

1. Because stock market volatility is inherently uncertain, our primary goal with this verification process is to evaluate Acumeta's training effectiveness and real-world application from a short-term perspective.

2. By gathering large-scale data samples from many participating users, we can more efficiently enhance Acumeta's ability to optimize short-term trading behavior within market fluctuations.

3. Since these quantitative strategy signals are short-term stock trading suggestions and provided as a free service, we cannot promise short-term profits.

4. The core purpose of your participation is to help validate the value of our strategies. You are free to choose whether to expand your future involvement in stock trading, but our compensation-backed program will always have participation limits.

5. We are building long-term credibility, and yes, we aim to expand wealth creation, but right now, what matters most for this verification process is reliable data support. That's why we don't commit to specific profit targets during trades — although we may offer expected performance guidance.

Does that make sense to you, my friends?

FinLogic

If you've just joined our Quantitative Strategy Interactive Community, welcome. This community is dedicated to building long-term, efficient, and high-value investment sharing, and over the next few months, all of this will be available to you for free. The purpose is to create a direct, face-to-face communication channel with our users, so we can hear your feedback directly — whether it's about our quantitative strategies, about Acumeta, about our analyst team, or about the actual investment results. Your objective suggestions will help us improve.

I believe that in the coming period, through real market practice, we will attract more investors' attention and further build the brand value of FinLogic Quantitative Think Tank Center.

Letting more investors witness and benefit from Acumeta is the driving force behind all our efforts.

Dear friends, for official, secure information, please visit our website: https://www.finlogichub.com.

I look forward to enjoying this new era of AI-powered quantitative

FinLogic

wealth with you.

Monday Market Close — Summary Insights from Dr. Charles H. Sloan:

Dr. Charles H. Sloan believes that today's overall downturn and volatility in U.S. equities mainly stem from the various uncertainties around tariff negotiations. Compared to April, the market now shows more patience, and there's a broader understanding that Trump may make compromises on tariff issues in different ways. This expectation has led to temporary pressure on stock indices. Although we saw a slight increase in fear sentiment on Monday, the willingness to sell wasn't strong. On the contrary, after the indices moved lower, it actually increased buying interest.

Therefore, it's foreseeable that TACO is expected to become a new sentiment indicator for the stock market.

Meanwhile, Trump's next tariff deadline on August 1st is unlikely to bring major surprises. The market's rational attitude toward this timeline has created new trading opportunities for the week.

Many of you may have been wondering — why did Trump insist on launching a tariff war? And why hasn't the Biden administration taken such aggressive action?

If you're already asking these questions, it shows you've started thinking more deeply — analyzing investment from a broader, long-term perspective.

First, we need to understand this fundamental concept: when countries do business with each other, when goods and resources are exchanged across borders, we call that trade.

And trade relies on currency as its foundation. But there's no single, unified global currency, so exchange rates and foreign reserves play a critical role in this system.

Let's say Country A wants to sell goods to the United States — they receive U.S. dollars in return. But if Country A also wants to buy American high-tech products, they need U.S. dollars to do so.

In this kind of trade relationship, if Country A consistently sells more goods and resources to the U.S. than it buys from the U.S., the result is simple: the U.S. ends up paying more dollars to Country A.

In other words, Country A profits from the trade, while the U.S. plays the role of the consumer, spending its money in the process.

So under this scenario, what kind of economic changes does the U.S. face?

It leads to more capital outflow and more manufacturing shifting to lower-cost regions in Asia, which in turn drives up unemployment rates in the U.S. This is a key factor slowing down America's economic growth.

At the same time, as a major consumer nation, the U.S. is heavily dependent on imported goods, which are easily influenced by price fluctuations driven by various global factors. When U.S. interest rates decline, it often triggers price increases and adds inflationary pressure.

This is why, during Trump's administration, tariffs became a tool to try and rebalance trade.

Continuing with the example of Country A — Trump's goal was for Country A to pay higher tariffs when selling goods and resources to the U.S., so the U.S. could collect more tax revenue.

Meanwhile, American exports of high-tech products to Country A would ideally benefit from lower or equal tariff rates, helping the U.S. earn more from that trade relationship.

This approach also encouraged U.S. companies to increase domestic investment, create more local jobs, and benefit from policies like The Big Beautiful Act — a series of tax incentives aimed at attracting capital back to the U.S.

In essence, this was Trump's interpretation of making America great again — through trade, taxation, and strategic economic shifts.

At a deeper level, tariffs are fundamentally tied to the strength of the U.S. dollar.

As we all know, the United States is a major consumer market. For countries around the world that want to sell their resources and products, the U.S. is a critical destination.

At the same time, the U.S. is a global leader in high-tech products and equipment — think AI, semiconductors, and other advanced technologies. If you want to purchase American high-tech equipment, you need to pay in U.S. dollars.

And the most direct way to acquire U.S. dollars is through trade — doing business with the U.S. and earning dollars through exports.

This global demand for access to the U.S. market naturally fuels the need for countries to hold U.S. dollar reserves. The tariff war, in this context, becomes a tool to influence and, in some ways, accelerate that reserve process.

If a country wants to earn more U.S. dollars, it may need to accept new terms or conditions in exchange for tariff exemptions. This, in turn, strengthens their position in trade with the U.S. — and gives them greater access to the dollars they're pursuing.

This tariff-driven pressure ultimately serves one core purpose — to push other countries to accept higher quotas for purchasing and holding U.S. debt in the future.

That's why negotiations are, at their core, a constant balancing act — both sides weighing the pros and cons of how they want to conduct business together.

If Country A is unable to establish more trade ties with the U.S., its companies may struggle to sell their products and generate profits. For Country A, this situation could trigger economic decline and rising unemployment at home.

Under that pressure, if Country A eventually agrees to Trump's terms, the tariff situation can ease, creating more favorable trade conditions.

But if Country A refuses to accept Trump's terms, tariffs will increase sharply, leading to a real risk of domestic economic downturn or even recession.

So what's Trump's real goal behind all of this? Selling U.S. debt. To put it simply — the idea is that you hold more of our debt, give those U.S. dollars back to us, and, in a way, lend the dollars you earned from trade right back to the U.S.

Yes, U.S. Treasury bonds are essentially an IOU — a formal certificate of debt.

The U.S. Treasury needs more buyers for its government bonds — and those buyers need to accept lower interest rates.

That's exactly why the debt expansion under The Big Beautiful Act aims to push total U.S. debt to $40 trillion. Only then can fresh capital start flowing back into the U.S. economy, providing the liquidity needed for the next stage of economic growth.

With this in mind, we can better understand the core purpose behind tariffs — they are also part of the broader strategy to manage the U.S. debt crisis.

Trump is working on two fronts: securing the authority to raise the cap on new bond issuance, while simultaneously looking for new buyers for those bonds.

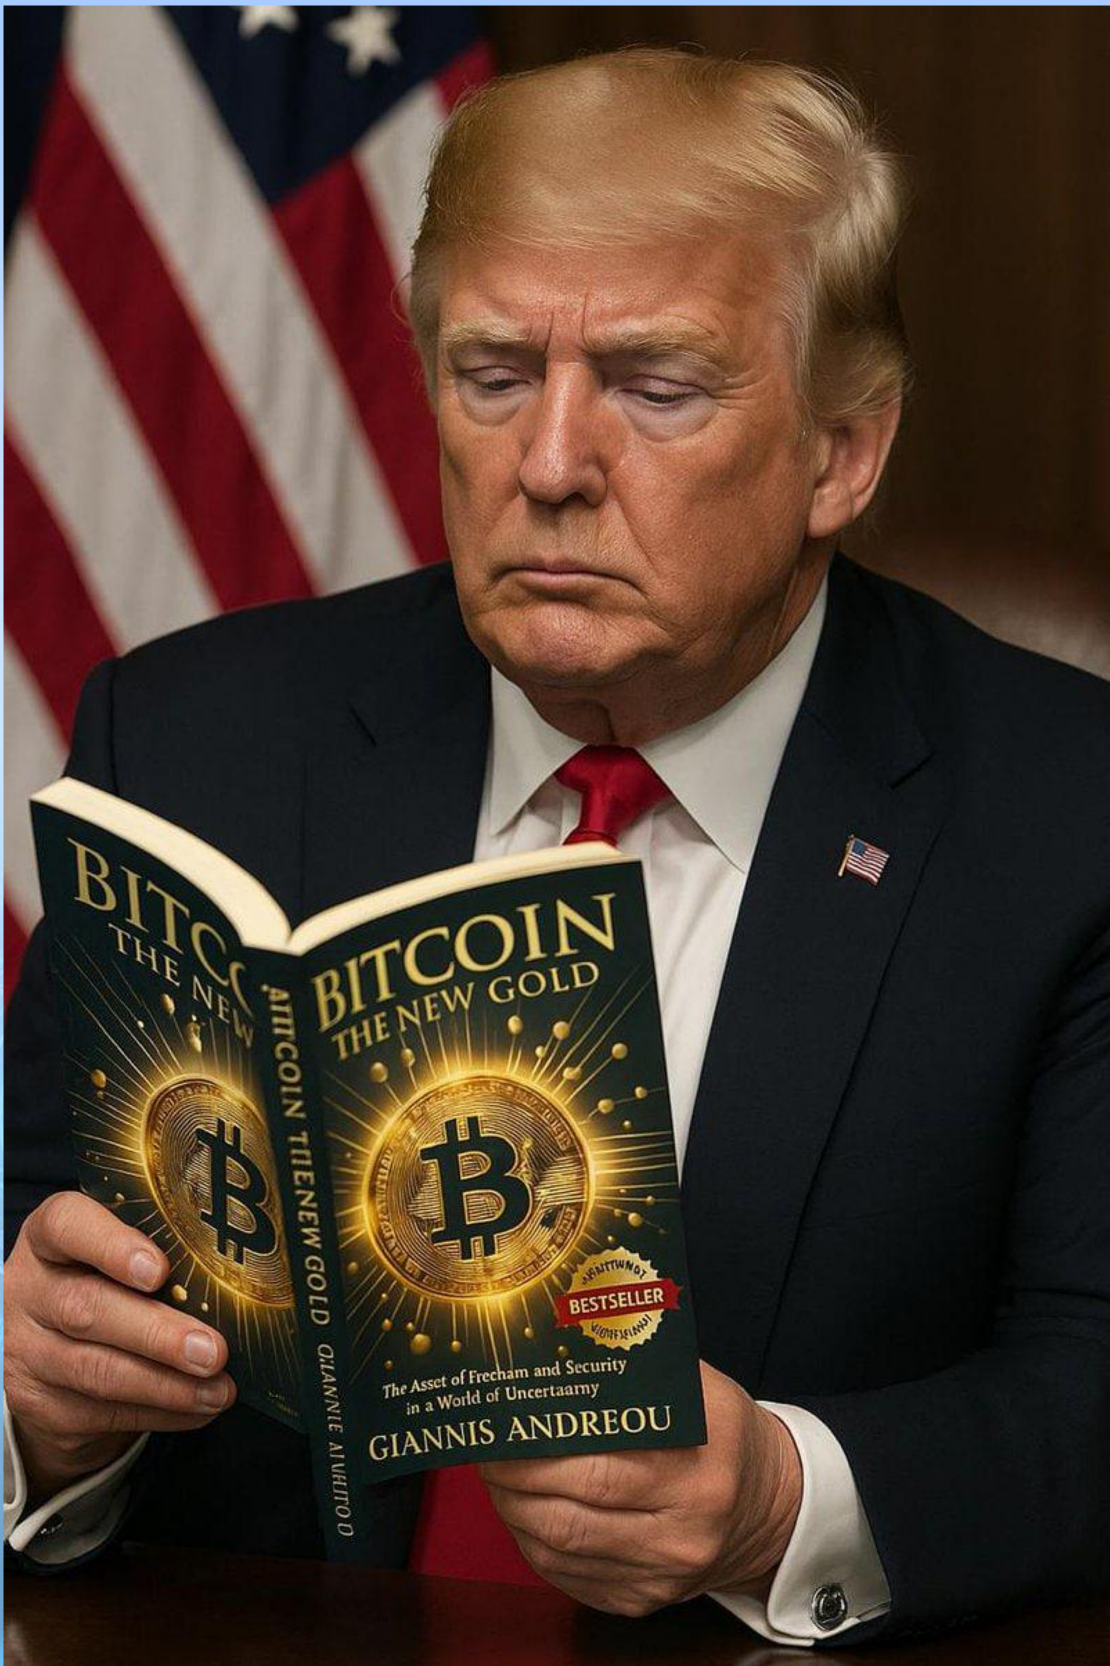
And the final piece of this puzzle? The Federal Reserve's rate cuts. When new government bonds can be issued at lower interest rates and attract more buyers, the financing generated doesn't just cover old debts — it also creates room for renewed economic expansion.

That's how Trump's political agenda takes shape — leveraging debt, trade, and monetary policy to "Make America Great Again."

In this context, a different voice has started to emerge — some countries, let's take Country A as an example, are beginning to explore ways to bypass the U.S. dollar in their international trade. This approach is known as reducing dollar dependency.

So, how did Trump prepare for the potential downside of his tariff pressure strategy? How did he try to counteract the risk that countries might move away from the dollar?

The answer, in fact, lies in cryptocurrency — specifically, Bitcoin. As for the deeper reasoning behind that, I'll be sharing a full series of insights once I'm officially back with our regular sessions. So be sure to stay tuned for my daily updates.



Once we understand why Trump launched the trade war, and why it keeps getting extended — this time to August 1st — it becomes clear that the goal goes beyond short-term inflation relief. It's also about securing more favorable negotiations with countries like A. On the other hand, this also explains why the current market volatility hasn't stopped the stock market from pushing higher in the short term.

Because we know, at a deeper level, the trade war is only the surface. The real objective is to ease tensions, gain leverage, and secure greater benefits through negotiation.

Thank you to Dr. Charles H. Sloan for the insightful explanation of the core logic behind the tariff war. I hope this provides our community members with a highly intelligent guide for making investment decisions.

Understanding the surface of investing and grasping its essence — that's exactly what we aim for with our quantitative strategy decisions.

Right now, both our quantitative strategies and Dr. Charles H. Sloan's viewpoints have been validated through real stock trading results. Acumeta is improving, becoming stronger and more reliable.

Dear friends, I've truly enjoyed hosting this program during this period. Thank you for your active participation, your engagement, and the tremendous support and warmth you've shown me.

I hope that tomorrow, when Dr. Charles H. Sloan takes over this space, everyone will interact more, explore more, and follow along with even stronger motivation. I hope you can truly benefit from the cutting-edge knowledge shared by our Quantitative Think Tank and grow from it.

In the future, I will continue to follow your progress. Please keep in touch. And I hope that Tuesday morning, when our doctor returns, the journey ahead is filled with flowers, and your applause rings out to welcome him back.

Thank you all. I'm your trusted quantitative advisor — Lauren D. Miller.
