

Wednesday, Aug 13, 2025

Folks, Wednesday is going to be a beautiful day!

It's an exhilarating morning, with the air thick with the scent of victory—almost unbelievable. The crypto world feels as if it's being guided by a higher hand, and right before our eyes, ETH is charging toward its all-time high. \$4,795—that once-distant figure from the 2021 bull market—is now within reach. It's like our team sinking the winning three-pointer at the buzzer—nothing but net!

When ETH truly breaks its all-time high, do you know the kind of

FinLogic

on-chain wealth secrets that implies? This isn't just a number being replaced.

It represents the maturity and prosperity of the entire Ethereum ecosystem.

It means more developers joining in, more real-world assets being tokenized on Ethereum.

It's like a city where skyscrapers keep rising one after another—you're not just seeing the buildings themselves, but the powerful economic vitality and limitless growth potential behind them.

Let's think back to last October and November—what happened right after BTC broke its all-time high?

At the time, many still doubted it, dismissing it as a bubble.

But what did I see? I saw that once BTC broke free from its old constraints, vast capital began pouring into the entire crypto market, lifting second-tier, third-tier, and even the broader ecosystem across

the board.

BTC's new high was like a floodgate thrown open, sending a constant surge of capital into every corner of the digital asset world. Now, ETH is playing that same role. It's not only pushing itself toward new highs—it's about to set off an unprecedented wave of momentum for the entire Ethereum ecosystem, and indeed, for the broader crypto market.

As for the upcoming September rate cut, I want to be clear: it may not be just another routine shift in monetary policy. It could well be the single greatest wealth-acceleration opportunity of your lifetime.

We are heading into a September rate cut of a very different kind.

A cut means cheaper capital and more abundant liquidity.

History shows that every major rate-cut cycle has been accompanied by a sharp surge in a particular asset class: U.S. equities in 2009, technology stocks and cryptocurrencies in 2020...

In every case, the biggest winners were the few who had the foresight to position themselves before the peak.

Let me conclude with a story. In Texas, there's an old rancher who, before every rainy season, repairs his fences, clears the pasture, and stocks up on feed.

The younger folks laugh at him— “The cattle aren't even fat yet,

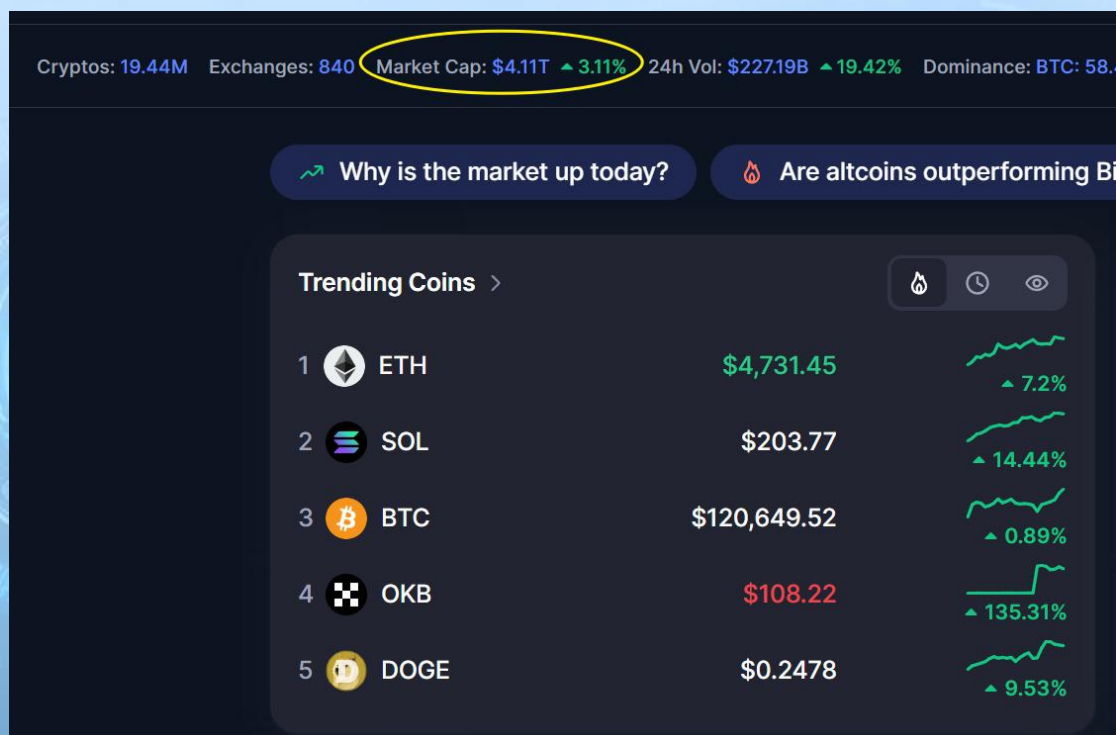

why bother?” He always replies, “By the time the cattle are fat, you won't be able to afford the feed.”

Guys, this moment for ETH is the crypto world's “rainy season on the horizon.”

We are not merely watching a price tick upward. We are standing before a gateway to a new era of wealth.

And that gateway may well be the most explosive wealth-creation opportunity of your lifetime.

Your choice is simple—step through it, or remain outside, watching others raise their glasses in celebration.

Today, the total market capitalization of global cryptocurrencies has officially crossed the \$4.1 trillion mark.

Folks, this isn't some arbitrary figure—it's a signal light, not unlike

that first moment in the 1980s when the internet connected for the very first time.

History teaches us that when the asset scale of an emerging field enters the “trillion-dollar” range, it ceases to be a niche toy for enthusiasts and begins to move onto the stage of national strategy. Remember the oil crisis of the 1970s? That was when the world realized that energy was not merely a commodity—it was a lever of geopolitical power.

Today, digital assets are following a similar trajectory, except their “oil fields” are made up of computing power, algorithms, and a global network.

There's an old saying: money talks, but strategy whispers in your ear. And that means the true players don't simply watch price fluctuations—they focus on who ultimately holds the power to shape the rules.

We have seen this pattern play out many times in history—railroads, automobiles, the internet.

Each time, when an industry's scale and influence reach the point where it can steer the flow of global capital, it moves beyond being merely a “business opportunity” and becomes a matter of national competitiveness.

Behind cryptocurrency lies the decentralization of payment systems, the liberalization of cross-border capital flows, and an entirely new hedge against inflation risk.

For those who understand, this isn't speculation—it's participation in shaping the rules of a new financial order.

Don't fixate solely on today's price swings, just as you wouldn't use a single day's weather to predict long-term climate change.

The story of cryptocurrency is only in its second chapter.

Today's \$4.1 trillion market capitalization is merely the trailer—the real feature hasn't even begun.

To borrow a bit of slang—you haven't seen anything yet.

At today's investment roundtable,

I want to address a topic that will make Wall Street veterans, Main

Street newcomers, and even that neighbor who can't stop talking about the weather lean in—rate cuts.

You see, a rate cut is like adding a bit more oil to the engine of the economy. It doesn't just make the gears turn more smoothly—it also puts a hint of sweetness in the air for the markets.

Especially when the rate cut exceeds expectations—that's the Fed suddenly opening the faucet wider, letting liquidity rush in like a spring flood.

In moments like that, smart money moves quickly to find an outlet—and more often than not, that outlet is stable, dividend-paying, risk-resistant high-yield assets, such as preferred stock ETFs like PFF.

Meanwhile, IWY will continue to benefit from this environment, sharing in the overall profitability of the tech sector.

But that leads to the real question—how do we prepare for the inflationary outlook that such rate cuts almost inevitably set in motion?

Let me share a brief historical story: during the Cold War, the United States invested heavily in building the GPS satellite network. At the time, many people didn't understand—who would need this outside the military?

Thirty years later, companies like Uber, Amazon, and Google Maps

rely on it entirely to function.

Today, cryptocurrency is much the same as GPS in the 1980s—you might think it's only for geeks and traders, but when it's integrated into payments, supply chains, and international settlements, it becomes strategic infrastructure.

And could BTC and ETH become “superheroes” in countering the inflationary effects triggered by rate cuts?

It sounds a bit like science fiction, but the logic is actually far simpler than you might think.

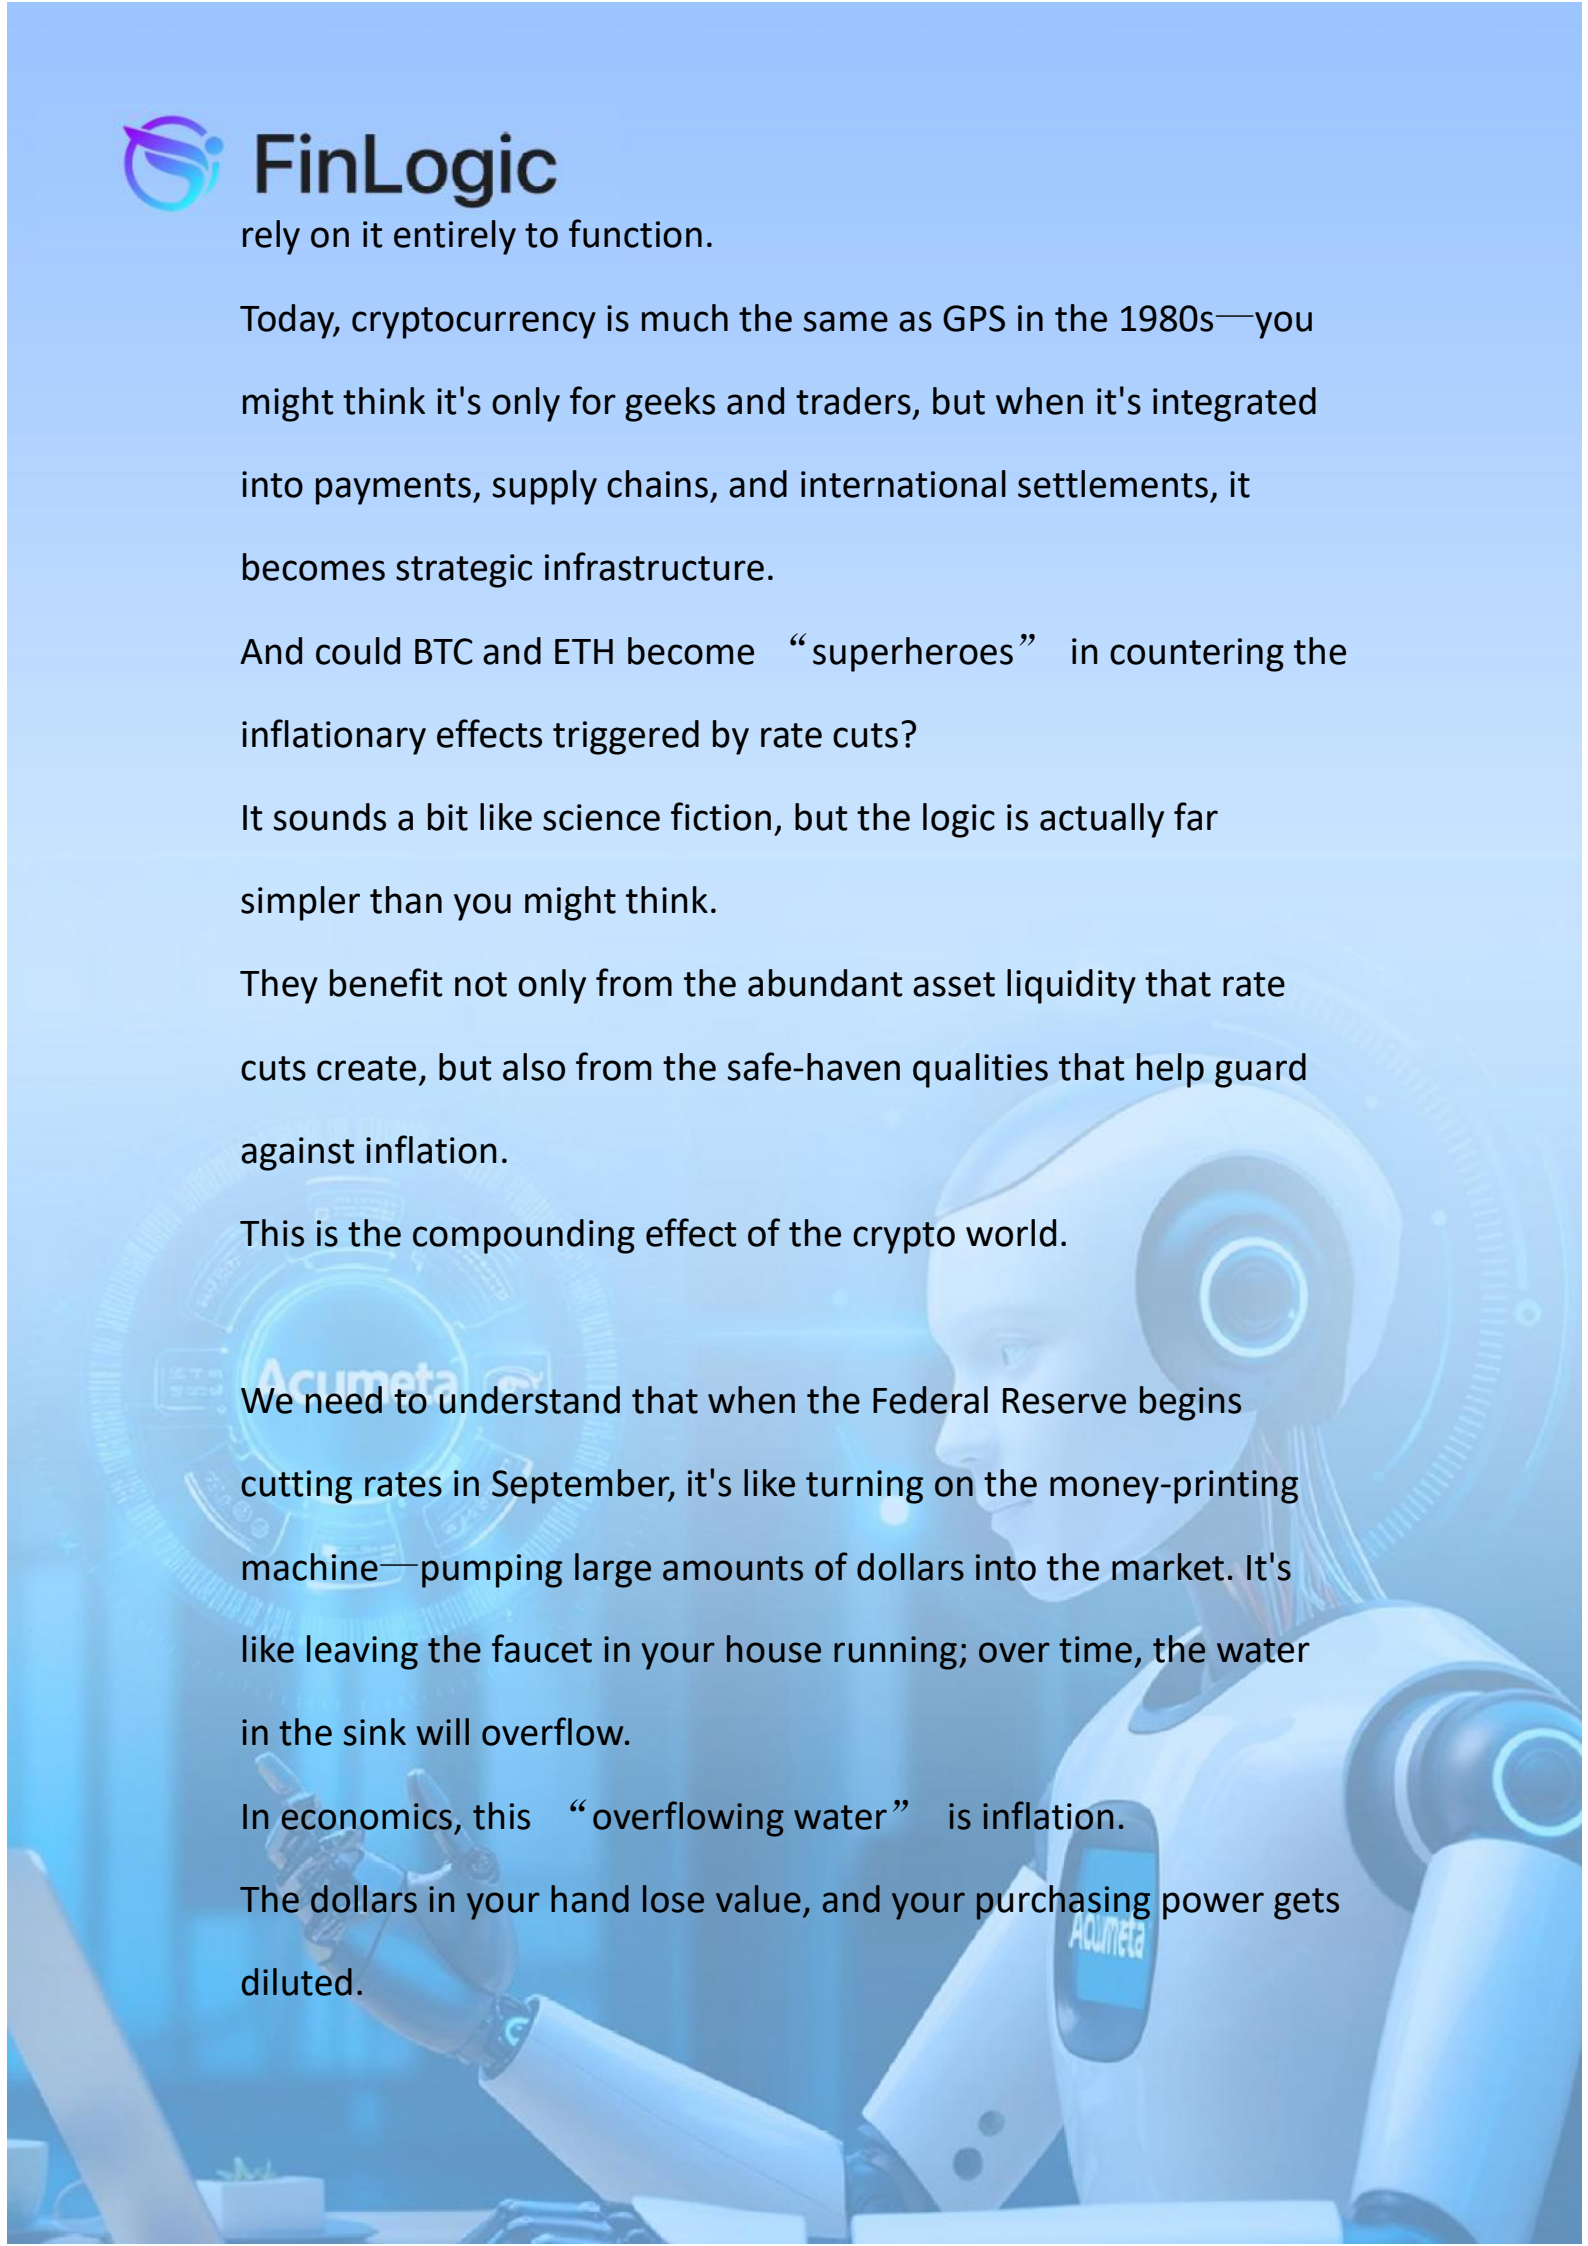

They benefit not only from the abundant asset liquidity that rate cuts create, but also from the safe-haven qualities that help guard against inflation.

This is the compounding effect of the crypto world.

We need to understand that when the Federal Reserve begins cutting rates in September, it's like turning on the money-printing machine—pumping large amounts of dollars into the market. It's like leaving the faucet in your house running; over time, the water in the sink will overflow.

In economics, this “overflowing water” is inflation.

The dollars in your hand lose value, and your purchasing power gets diluted.

It feels as if the money you worked so hard to earn quietly

“vanishes down the drain,” doesn't it?

So why can BTC and ETH serve as “secret weapons” against inflation?

It comes down to their scarcity and deflationary nature.

BTC's design is like that of a strict “economic autocrat.”

Its total supply is capped at 21 million coins—no more, no less.

It's like discovering a gold mine during America's westward expansion, knowing that the total reserves are fixed and will never increase. At the same time, thanks to the halving mechanism, the effort required to obtain it only grows over time.

It's akin to folding a sheet of A4 paper in half repeatedly— $1/2$, $1/4$, $1/8$, and so on—the difficulty increases exponentially with each fold.

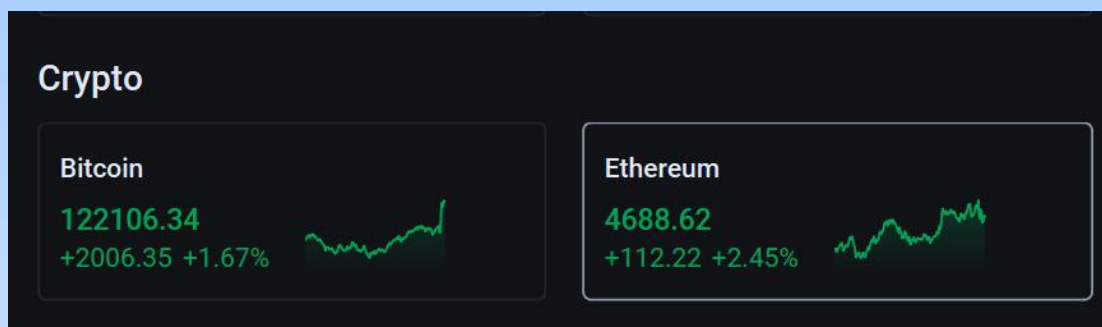

When everyone is holding increasingly devalued dollars while chasing a limited number of BTC, the price naturally rises.

Its scarcity acts like a solid “fortress,” effectively shielding it from the erosive effects of inflation.

This is precisely why many consider BTC to be “digital gold.”

Ethereum's design is like that of an “economic alchemist.”

Although its total supply is not fixed like BTC, it has a crucial mechanism—automatic burning.

This mechanism destroys a portion of ETH based on network activity.

This means that as the Ethereum ecosystem grows and more people transact on it, increasing amounts of ETH are being “burned.” Over time, this creates a deflationary effect.

It's like a vibrant city: the more developed its economy and the larger its population, the more resources are consumed. Ethereum is such a city, and its prosperity, through the burning mechanism, makes ETH increasingly scarce.

The U.S. finance minister has made it clear: a compensatory rate cut is coming, starting with 50 basis points in September, totaling 150 basis points. This is a rate cut far beyond what the market anticipated.

The first wave of excitement from an unexpected cut is the surge in asset prices—explosive gains. Already, we are witnessing

cryptocurrency expanding far beyond expectations.

So what's the wiser choice for us?

It's to select an investment that both hedges against inflation expectations and delivers returns above the anticipated premium.

This is precisely the forward-looking value of the “Win the Race for Reserve Digital Token Challenge.”

Saving a dollar is a dollar devoured by inflation. Holding BTC and ETH, however, is like discovering a “lifebuoy” against that erosion. Therefore, when the wave of rate cuts sweeps in, we can no longer let our money lie dormant in the bank.

We should embrace crypto assets that resist inflation—and may even carry deflationary qualities—to seize the opportunities this era affords us.

This is not merely about wealth; it is about defending the value generated by our own diligent labor.

On-chain crypto assets are quietly building toward a moment that could mint not just millionaires, but billionaires. Yet, this is not a tide that will lift every boat.

Those with foresight already understand the next steps.

Now, you certainly hold, more or less, the token vouchers issued by my Quantitative Think Tank Center.

With the Token FGT Redemption Carnival set for August 18, I

imagine you'll want clarity on a few points:

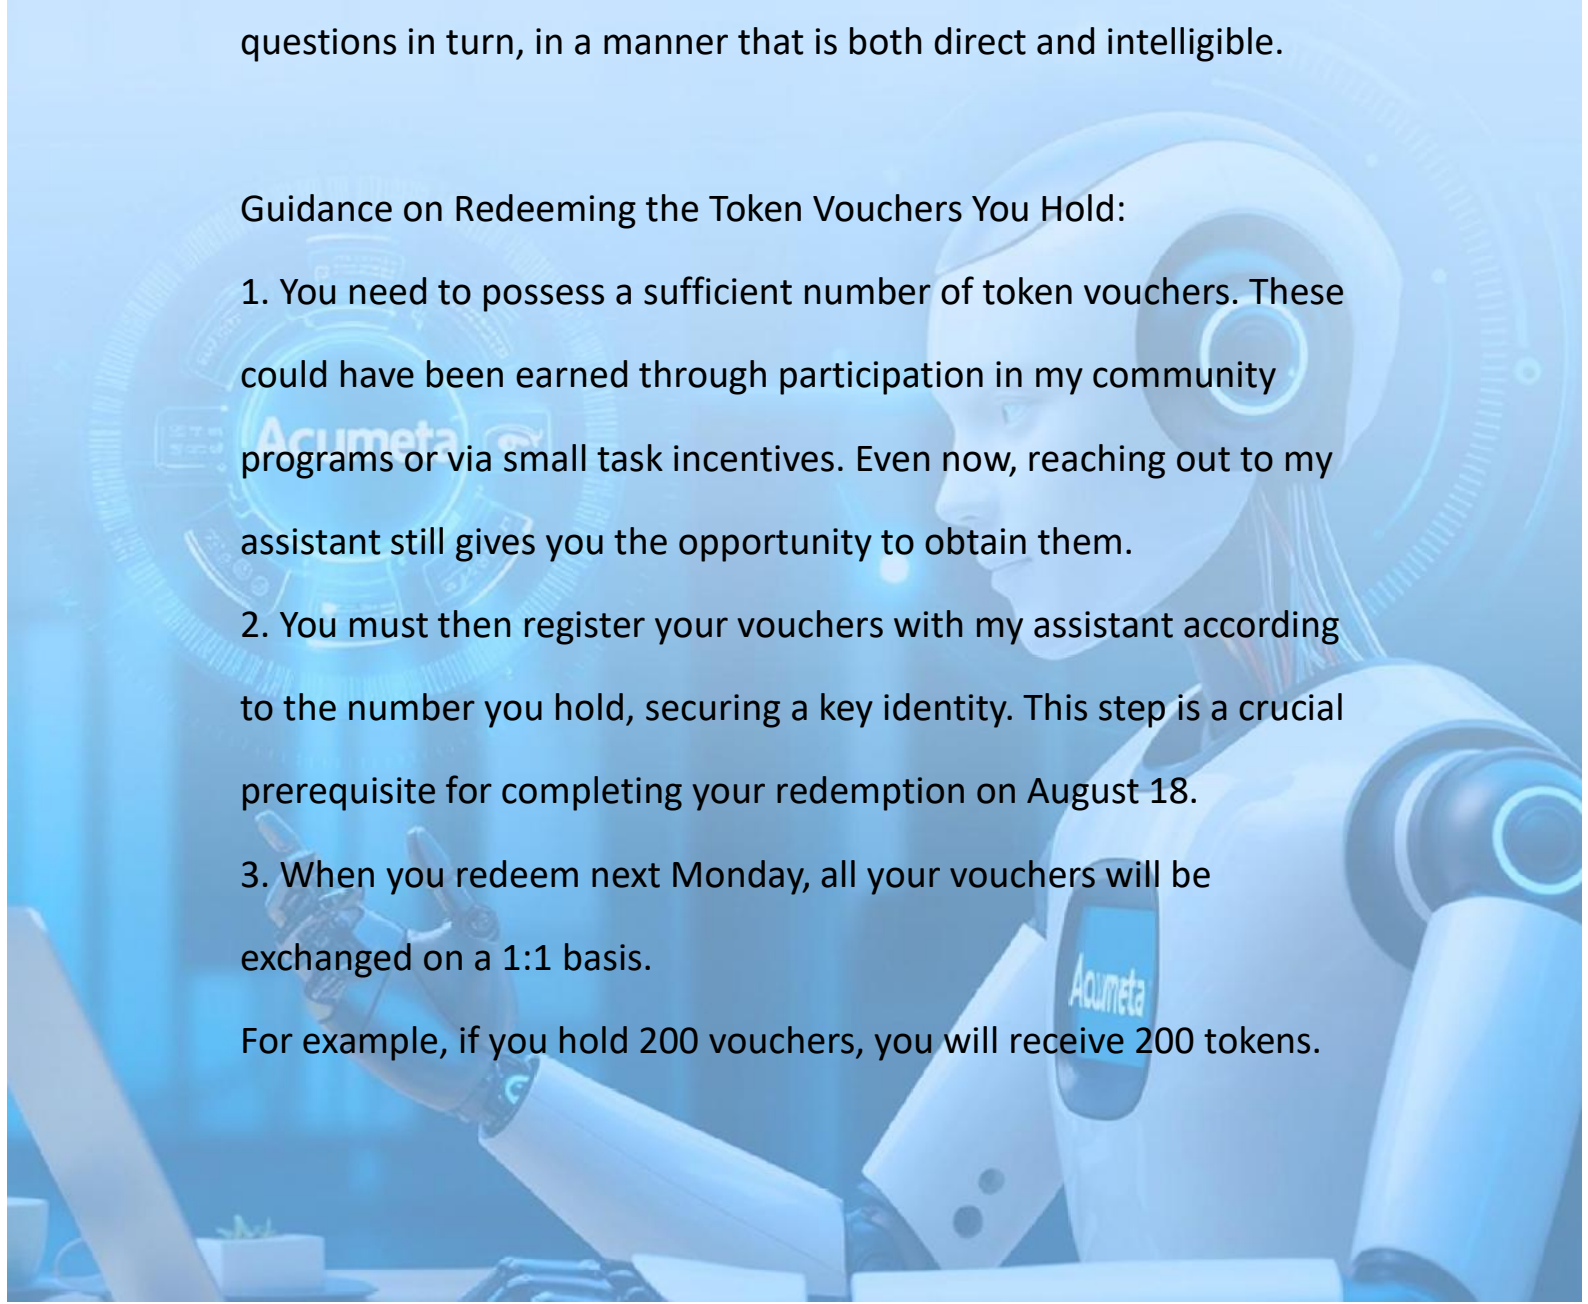

1. How exactly do you redeem them?
2. Where are your tokens currently held?
3. What is their present market price—and what is the value you'll hold after redemption?
4. How has the token performed in the past, and what is its outlook going forward?

So—stay with me here. I will walk you through each of these questions in turn, in a manner that is both direct and intelligible.

Guidance on Redeeming the Token Vouchers You Hold:

1. You need to possess a sufficient number of token vouchers. These could have been earned through participation in my community programs or via small task incentives. Even now, reaching out to my assistant still gives you the opportunity to obtain them.
2. You must then register your vouchers with my assistant according to the number you hold, securing a key identity. This step is a crucial prerequisite for completing your redemption on August 18.
3. When you redeem next Monday, all your vouchers will be exchanged on a 1:1 basis.

For example, if you hold 200 vouchers, you will receive 200 tokens.

FinLogic

If you hold 800 vouchers, you will receive 800 tokens.

Assuming the token's price is 1 USDC, the moment you receive your tokens, you will hold 800 USDC in value—effectively \$800 in on-chain assets.

This reflects the rewards you have earned over the past few months through your engagement in various community activities.

And if Token FGT continues to appreciate in the future, maintaining your holdings will yield even greater returns.

Plant a seed today, and you may harvest a tree tomorrow. Do you understand the principle?

As the chart illustrates, the current price of the token on the ETHERMAC cryptocurrency exchange hovers around 0.6 USDC.

This is a weekly candlestick chart, which clearly shows that the token was issued and listed on the exchange via STO in 2019—a critical moment when we urgently needed financing to expand Acumeta.

Earlier this year, the token's price surged to a peak near 3.4.

Compared with today's price, that historical high still leaves room for a potential increase of over 500%.

The initial surge was driven by Acumeta's strong project progress and the confidence of certain venture investors, which translated into positive market performance. The subsequent decline was due to short-term liquidity pressures and higher financing costs brought on by the interest rate cycle.

Last September's rate cut once again propelled the token above 2 USDC, demonstrating that under the guidance of rate-cut expectations, the token's growth logic remains exceptionally robust.

Will the September 2025 rate cut propel the price of Token FGT even higher?

The answer is a resounding yes.

Through several reliable perspectives, we can clearly decode this wealth appreciation pattern:

1. My community forum's quantitative strategy portfolio has undergone months of rigorous optimization and validation, yielding significant results—one clear signal of the market's positive response.
2. Acumeta is currently experiencing validation in the equity

markets, with a success rate exceeding 90%. This indicates tremendous potential for further gains through continued optimization, making the prospect of a full-scale listing genuinely promising—another marker of confidence in the token's upward trajectory.

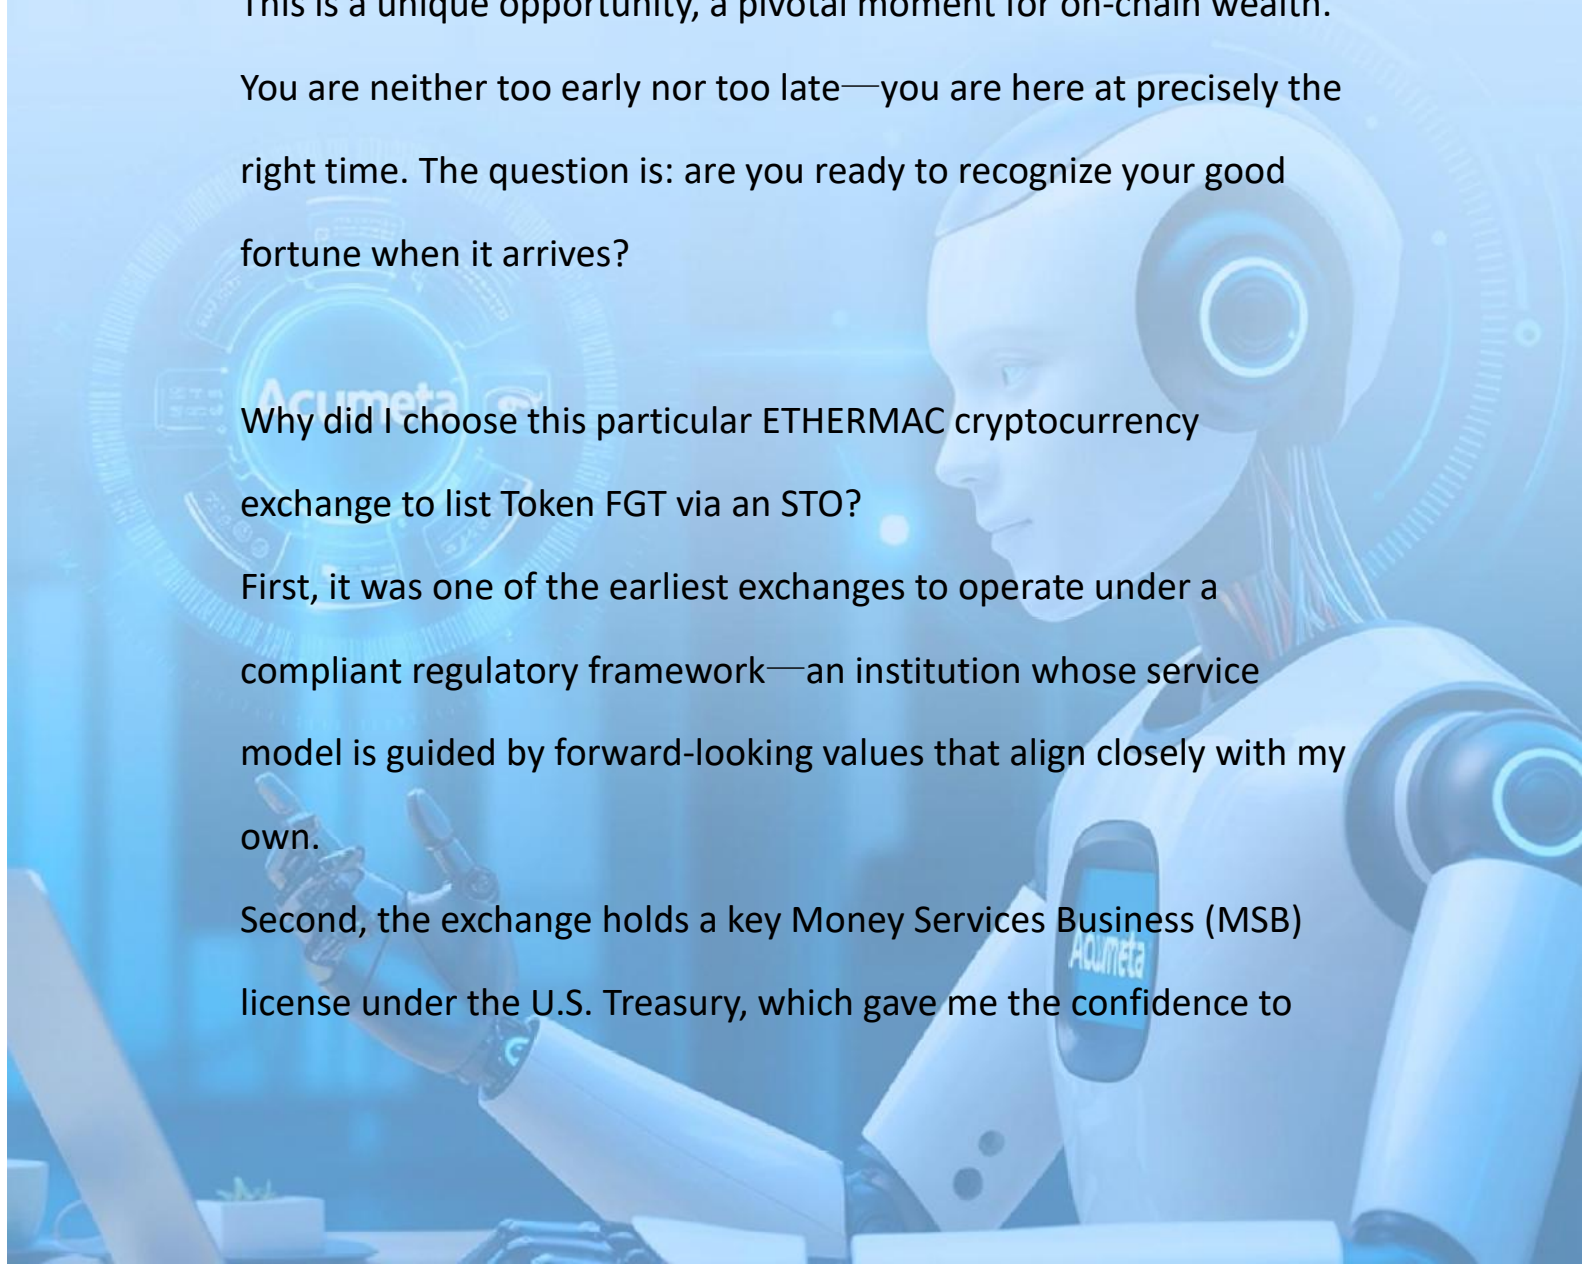

3. The timing of our upcoming Token Redemption Carnival coincides with a new round of above-expectation rate cuts—September's cut exceeding 50 basis points—signaling virtually limitless potential for future token appreciation.

This is a unique opportunity, a pivotal moment for on-chain wealth. You are neither too early nor too late—you are here at precisely the right time. The question is: are you ready to recognize your good fortune when it arrives?

Why did I choose this particular ETHERMAC cryptocurrency exchange to list Token FGT via an STO?

First, it was one of the earliest exchanges to operate under a compliant regulatory framework—an institution whose service model is guided by forward-looking values that align closely with my own.

Second, the exchange holds a key Money Services Business (MSB) license under the U.S. Treasury, which gave me the confidence to

entrust them with the trading and circulation of the token. Over the years, consistent observation has only reinforced my view that their execution is excellent, and that they have meaningfully advanced both the visibility and liquidity of the token.

Third, the exchange is proactively expanding into AI-powered capabilities, with a deliberate focus on enhancing the user trading experience—an approach to business I find both timely and compelling.

Fourth, it operates with a genuine sense of empathy and a philanthropic perspective. For that reason, I look forward to seeing Token FGT benefit from the broader horizons and enriched services such a platform can provide.

And finally, I welcome feedback. If, after your own experience with the exchange, you can offer insights or constructive observations, I will value hearing those perspectives—especially when they differ from my own.

Do you now understand how to reserve your spot and participate in the Token Redemption Carnival?

It's actually quite straightforward: you need to have token vouchers > complete the reservation registration > join the redemption carnival > receive your tokens stored in your account at

the ETHERMAC exchange.

Yes, that's the simple path to acquiring them! Did you get that?

And of course, today being Wednesday is a happy day. Not only do we now know the actual market value of the token vouchers in your possession, but you also have the chance to immediately access another exciting new listing price!

Well, this is about the BLSH IPO. Have you received your allocated shares in your brokerage account?

Check your holdings—see if BLSH appears in your stock lineup.

May fortune favor you in securing it!

Due to BLSH's IPO debut today, all you need to check is whether your brokerage account shows an allocated share—your lucky gift.

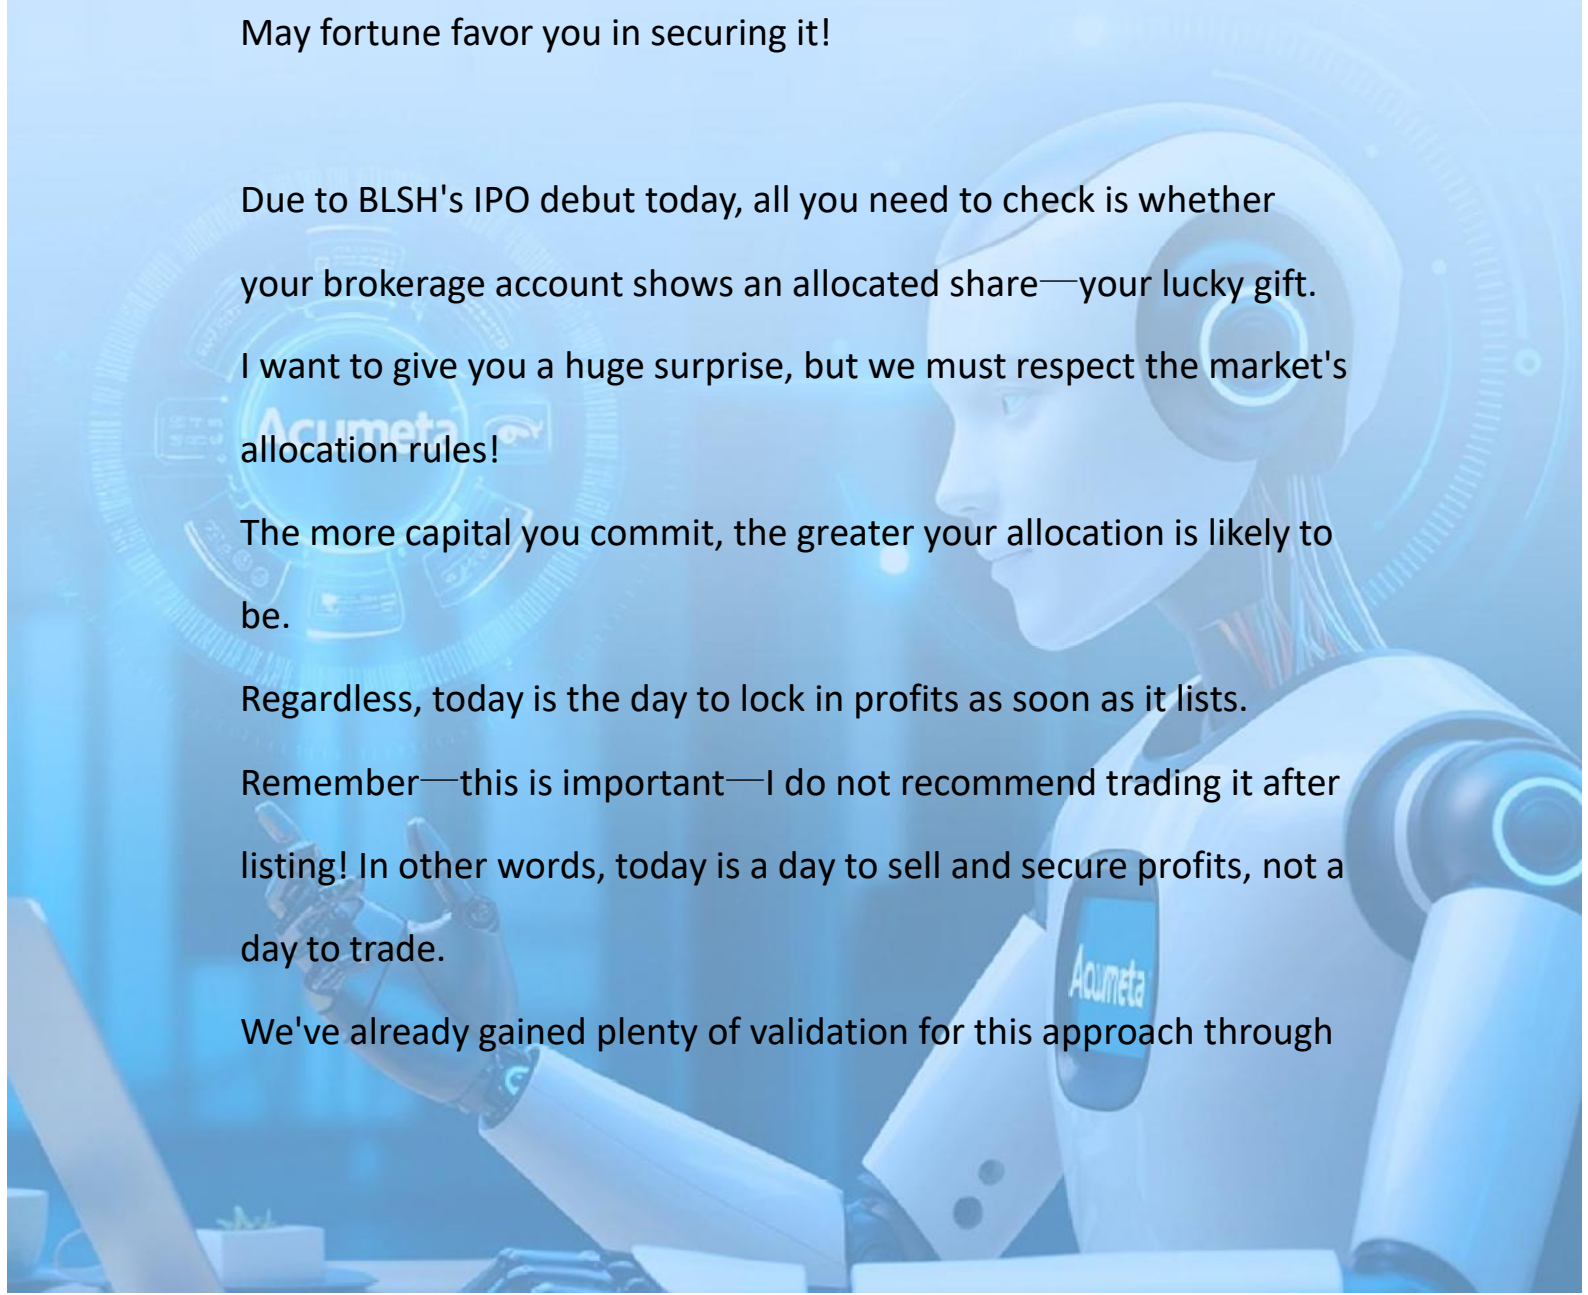

I want to give you a huge surprise, but we must respect the market's allocation rules!

The more capital you commit, the greater your allocation is likely to be.

Regardless, today is the day to lock in profits as soon as it lists.

Remember—this is important—I do not recommend trading it after listing! In other words, today is a day to sell and secure profits, not a day to trade.

We've already gained plenty of validation for this approach through

FIG, so I hope you don't forget that wisdom!

A classic mantra in investment circles: don't just buy the steak—own the cow.

The advantage of BLSH's low-priced IPO is precisely that while others are still lining up at the restaurant for the steak, you've already signed the contract at the ranch. The cow is yours.

Looking back, it's like buying beachfront property in Los Angeles early—you haven't just made a profit; you've strapped yourself into the roller coaster of wealth.

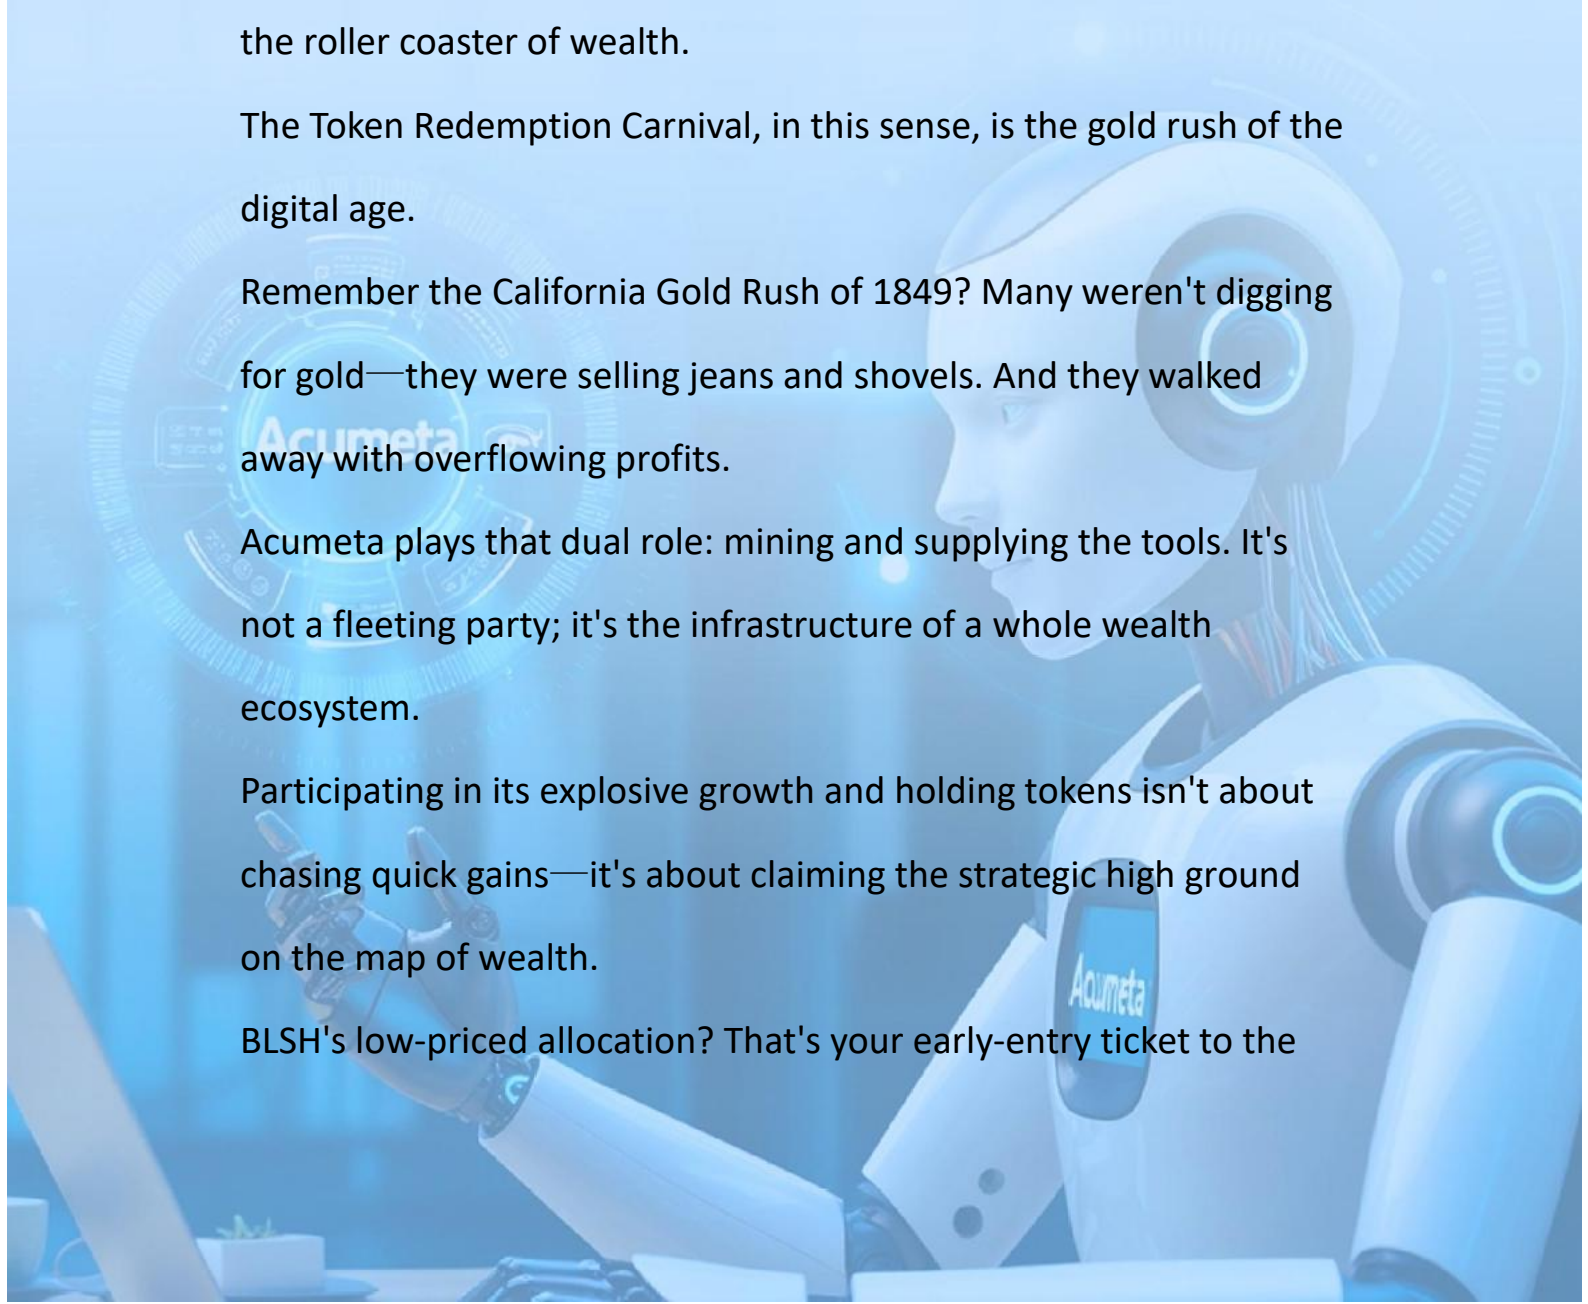

The Token Redemption Carnival, in this sense, is the gold rush of the digital age.

Remember the California Gold Rush of 1849? Many weren't digging for gold—they were selling jeans and shovels. And they walked away with overflowing profits.

Acumeta plays that dual role: mining and supplying the tools. It's not a fleeting party; it's the infrastructure of a whole wealth ecosystem.

Participating in its explosive growth and holding tokens isn't about chasing quick gains—it's about claiming the strategic high ground on the map of wealth.

BLSH's low-priced allocation? That's your early-entry ticket to the

dance floor.

Acumeta's Token Redemption Carnival? That's the DJ dropping the peak track—you either jump in and dance, or you watch from the sidelines, envious.

See you this afternoon, guys.

It was a remarkable afternoon—folks, are you feeling in good spirits?

Today, our attention rests squarely on the name that has held our collective focus for ten straight days—BLSH.

The long-anticipated contest for opportunity and wealth has finally begun, heralded by the opening bell of the NYSE.

So I find myself asking: in this exhilarating “debut,” what have we truly learned?

Yesterday, I ventured a bold projection—that BLSH's opening price might reach \$90.

And today, with the market's closing data now in, did the numbers bear that out?

This is not merely about confirming a figure.

It is about validating foresight—demonstrating that in a marketplace defined by uncertainty, the discipline of analysis and the clarity of judgment are assets of enduring value.

BLSH Bullish

52wk High	118.000	52wk Low	90.000	Historical High	118.000
Per Lot	1				

We now find ourselves in a singular moment.

The U.S. equity markets are trading with unusual intensity, driven by the near-certainty of a 25-basis-point rate cut in September.

It feels as though the music at the party has been turned all the way up, and everyone is moving to the beat.

But I have to ask—will this joy prove lasting?

Is it the overture to our next chapter of wealth creation, or—as

some fear—the last dance before the lights come on?

Let's not forget: a rate cut is not merely a shift in numbers.

It is the opening of liquidity's gates—a silent migration of capital.

And where will that money go?

It seeks velocity, potential, and a narrative compelling enough to command attention.

BLSH is hitting that precise note, much like a perfectly timed drumbeat in the crescendo of a jazz piece—impossible to ignore.

History reminds us that such windows often give rise to wealth stories that defy belief.

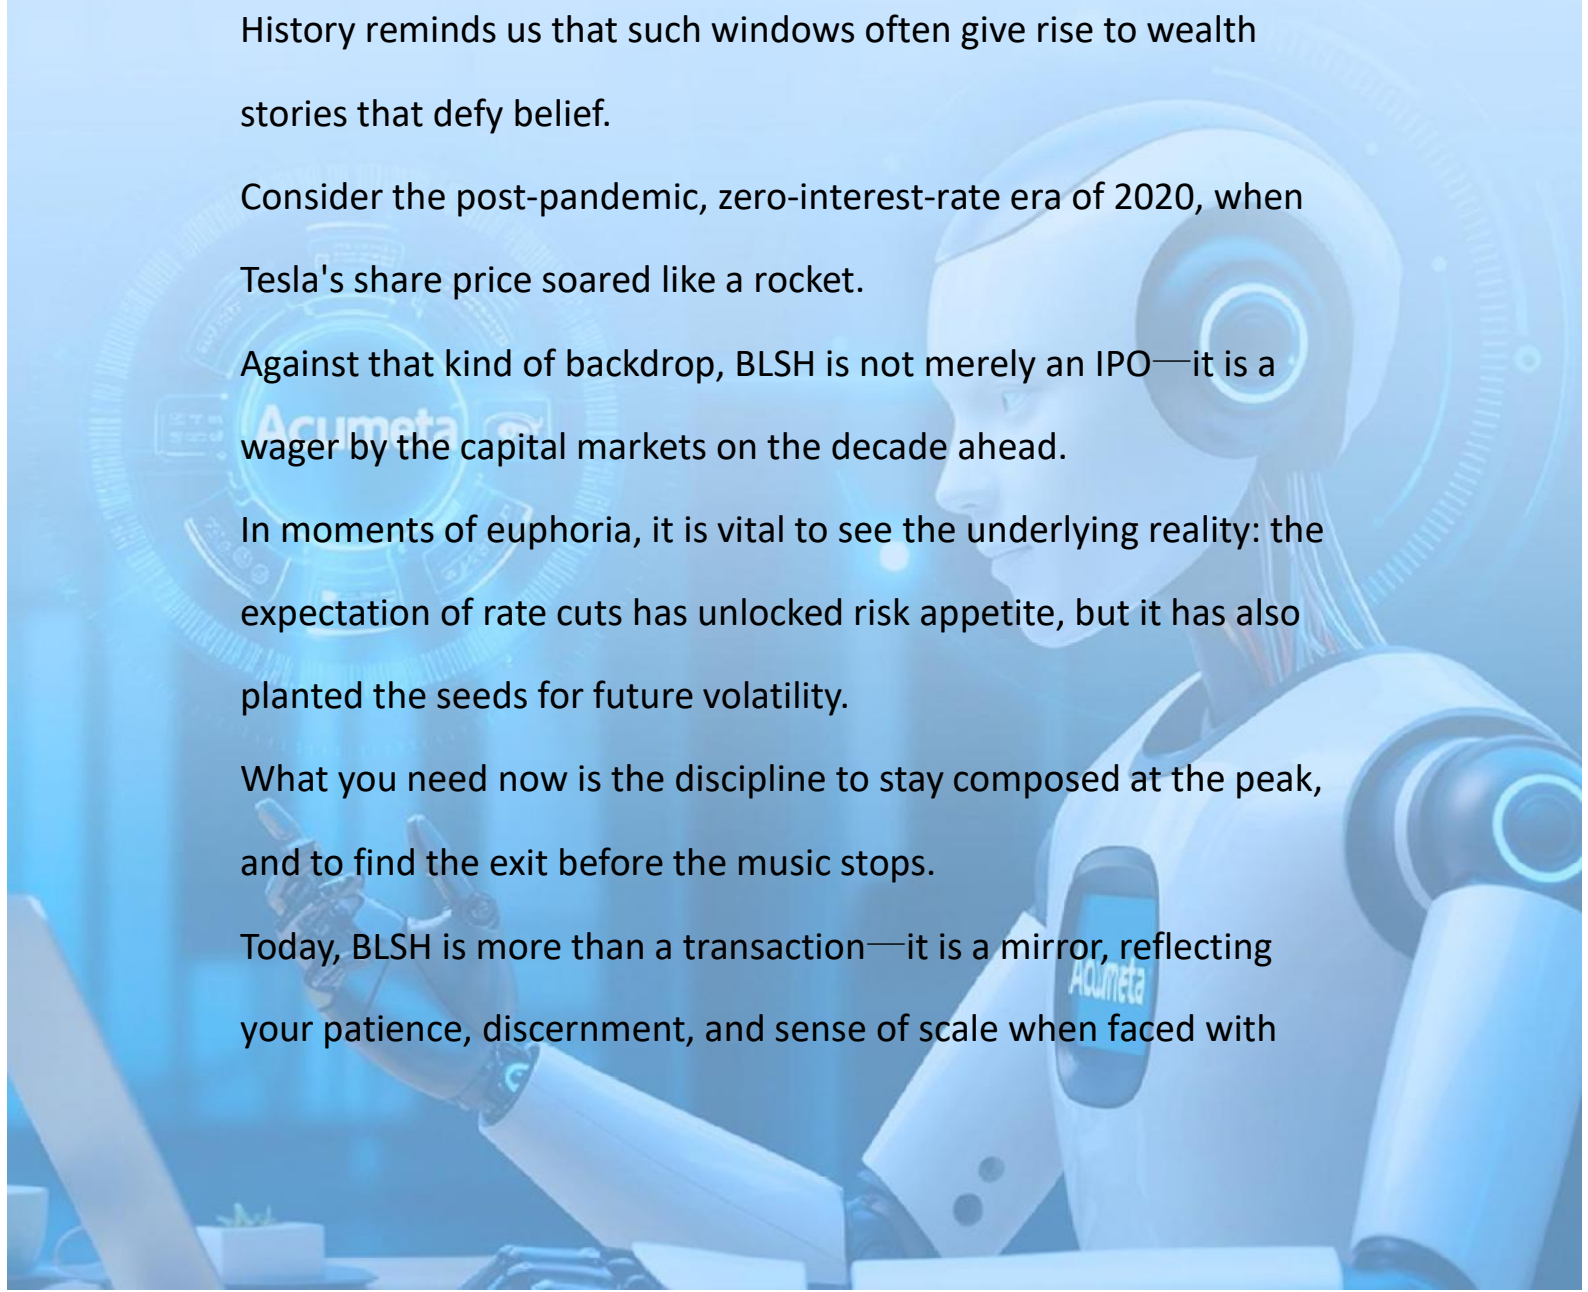

Consider the post-pandemic, zero-interest-rate era of 2020, when Tesla's share price soared like a rocket.

Against that kind of backdrop, BLSH is not merely an IPO—it is a wager by the capital markets on the decade ahead.

In moments of euphoria, it is vital to see the underlying reality: the expectation of rate cuts has unlocked risk appetite, but it has also planted the seeds for future volatility.

What you need now is the discipline to stay composed at the peak, and to find the exit before the music stops.

Today, BLSH is more than a transaction—it is a mirror, reflecting your patience, discernment, and sense of scale when faced with

Whether you are today's victor or a cautious observer, remember this: the capital markets are never short of opportunities.

What changes the course of a life is not their abundance, but your ability to seize the right moment—and to leave the stage smiling before the applause fades.

When everyone else is still asking whether BLSH still has a chance, whether they should buy in today—

You, with wisdom and forward-looking investment thinking, have already locked in your profits and exited.

The reason you can act with such calm and efficiency is:

First, you hold a huge cost advantage. That comes from the strong subscription intention you had during the subscription stage, which

expanded your subscription fund pool and ultimately gave you an efficient allocation.

Second, when your allocated cost was \$32 per share, and you looked at those scrambling for shares after listing, you understood how they had lost their reason or blindly joined in.

Third, your success has never been decided by the market, but by your own choices—by your firm and efficient logic of conviction.

God may not give you such a perfect opportunity again in the U.S. stock market, but perhaps in new coin projects, we can find different inspirations and opportunities.

The act of subscribing to a new stock at an advantageous initial cost is a zero-risk investment value concept. Have you mastered it?

Yet high-quality company offerings, coupled with a market frenzy for allocation, are difficult to foresee. Fortunately, over the past few months, we have witnessed several truly exciting cases.

Opportunities like these may never appear again.

However, the cryptocurrency market is in a stage of rapid expansion.

Here, we may yet see opportunities for new token STO listings.

If such an opportunity arises, I will tell you—and I will lead you in studying whether the STO project meets the criteria for quality, and in making the trading decision.

Would you be willing to join in such a meaningful exploration?

How do we determine whether a new token issuance project is of high quality—or, put another way, whether it holds the explosive potential of a case like BLSH?

Understanding this is critical to guiding our subscription decisions. Without it, the cost basis we gain from subscribing would lose its advantage.

Drawing on the performance of multiple past successes in new listings, Acumeta has developed an efficient, data-driven comprehensive evaluation. The recommendations are as follows:

1. A quality project, much like any sound commercial venture, must have both future prospects and market share. In other words, the product must be compelling.

Take BLSH as an example—its product serves cryptocurrency trading, with a particular focus on institutional clients of significant scale.

Coinciding with the rise of America's “Crypto Capital” and an era where institutions are building cryptocurrency reserves, this ensures market share.

2. From a compliance standpoint, it must meet both the demands of market imagination and the requirement for capital's safe landing.

BLSH exemplifies this, which is why it continues to attract sustained capital attention and investment.

3. A high-quality subscription opportunity must be supported by an overall industry valuation growth outlook.

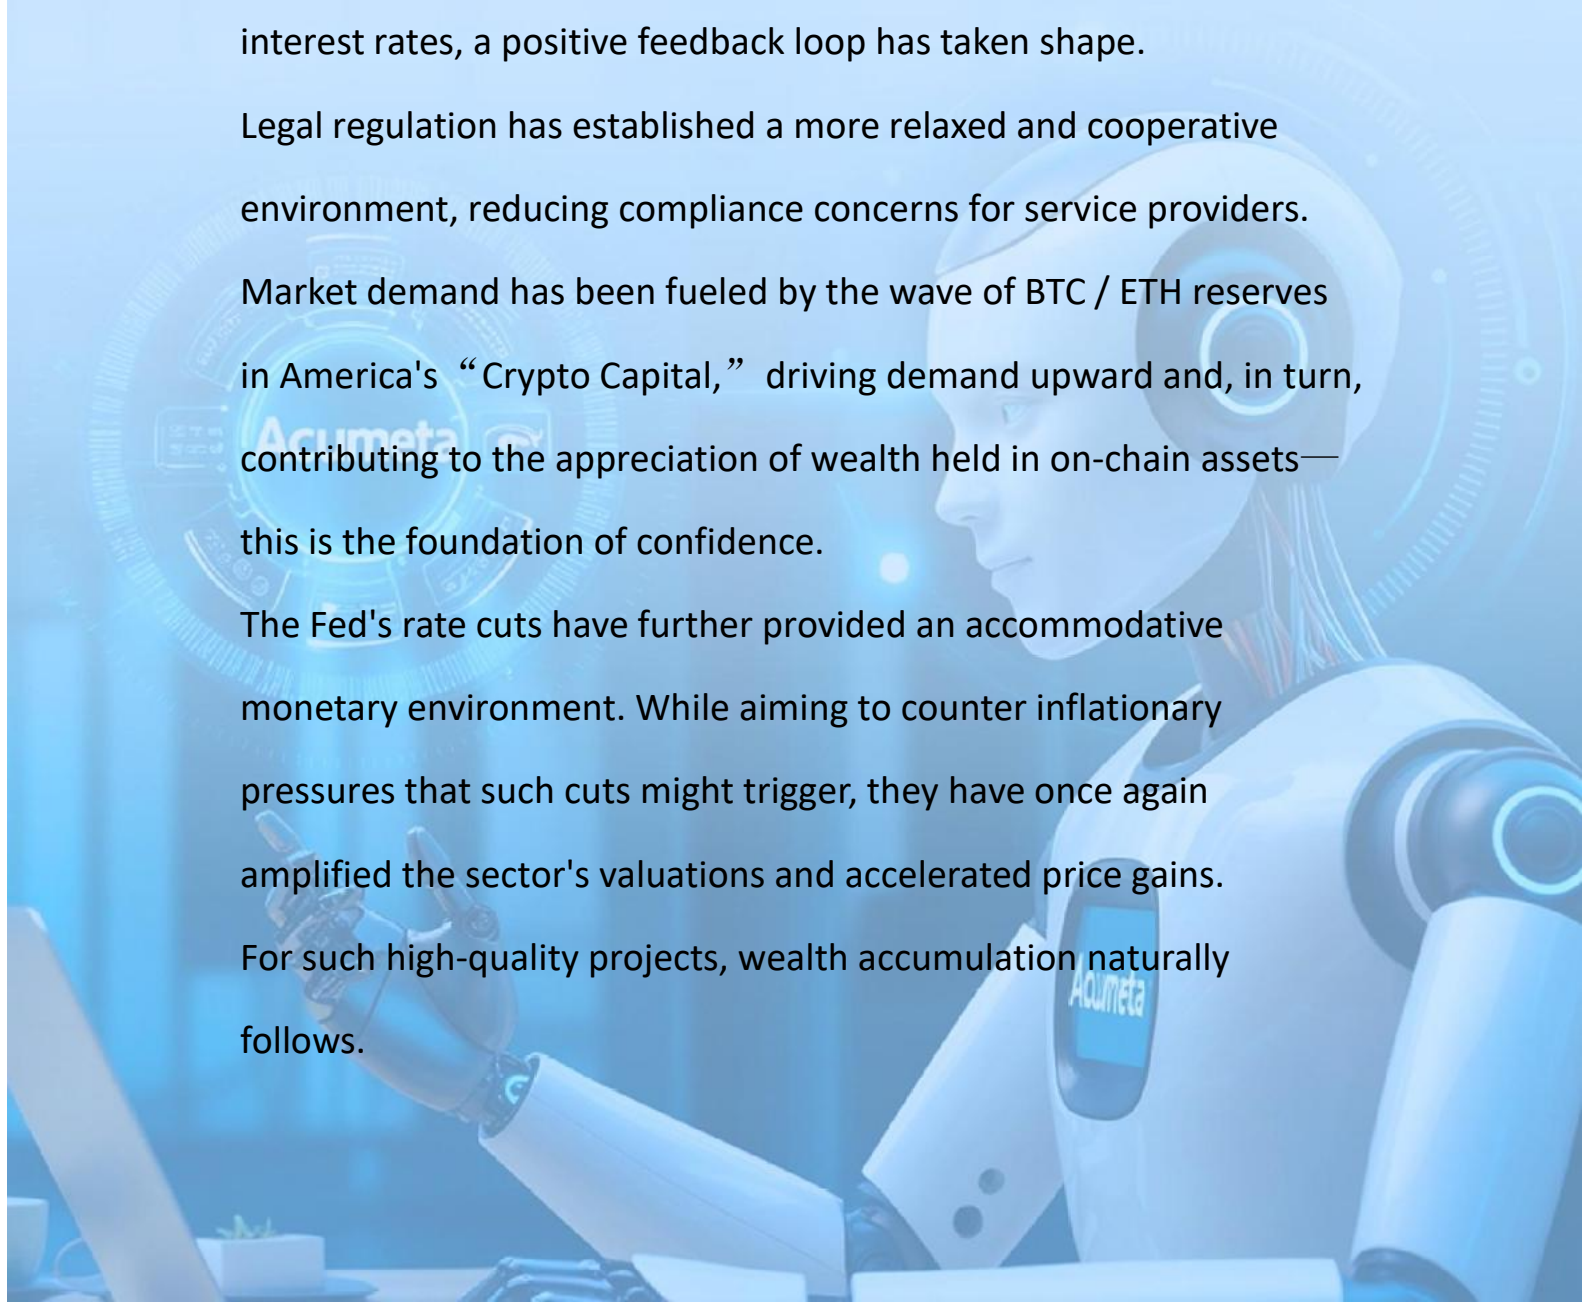

Take BLSH as an example—it belongs to the cryptocurrency sector, a new class of assets actively strengthened under the guidance of President Trump.

From legal frameworks, to stimulating market demand, to lowering interest rates, a positive feedback loop has taken shape.

Legal regulation has established a more relaxed and cooperative environment, reducing compliance concerns for service providers.

Market demand has been fueled by the wave of BTC / ETH reserves in America's "Crypto Capital," driving demand upward and, in turn, contributing to the appreciation of wealth held in on-chain assets—this is the foundation of confidence.

The Fed's rate cuts have further provided an accommodative monetary environment. While aiming to counter inflationary pressures that such cuts might trigger, they have once again amplified the sector's valuations and accelerated price gains. For such high-quality projects, wealth accumulation naturally follows.

So, if you encounter another project of this caliber, will you take part in its subscription?

BLSH Bullish					
Trading Aug 13 13:02:19					
102.440 ↑ +65.440 +176.86%					
High	102.440	Low	90.000	Open	90.450

Bid/Ask %	98.21%	Vol Ratio	—	Dividend TTM	—
52wk High	102.440	52wk Low	90.000	Historical High	102.440
Per Lot	1				

Perhaps the most straightforward gains from BLSH are not immediately intuitive, so let me illustrate with a simple example:

BLSH Subscription Plan — disregard your subscription service provider for the moment.

Suppose you subscribe with \$300,000, and in the final allocation you receive 300 shares of BLSH.

Your cost per share is therefore \$32.

This means your actual capital outlay is $300 \times \$32 = \$9,600$.

The \$300,000 you subscribed is not the cost—it is simply the capital you committed as an expression of intent, your way of signaling, in monetary terms, how much of the new share allocation you were seeking.

Now, on the day of listing, your 300 shares reach a peak price of over \$100.

If you were to sell at \$100, locking in your gains, the proceeds would be: $300 \times \$100 = \$30,000$.

Yes—you paid \$9,600 and received \$30,000.

Your net profit is \$20,400.

And the time required to realize this return? At most, ten days.

Would you consider that an efficient—and pleasantly surprising—investment?

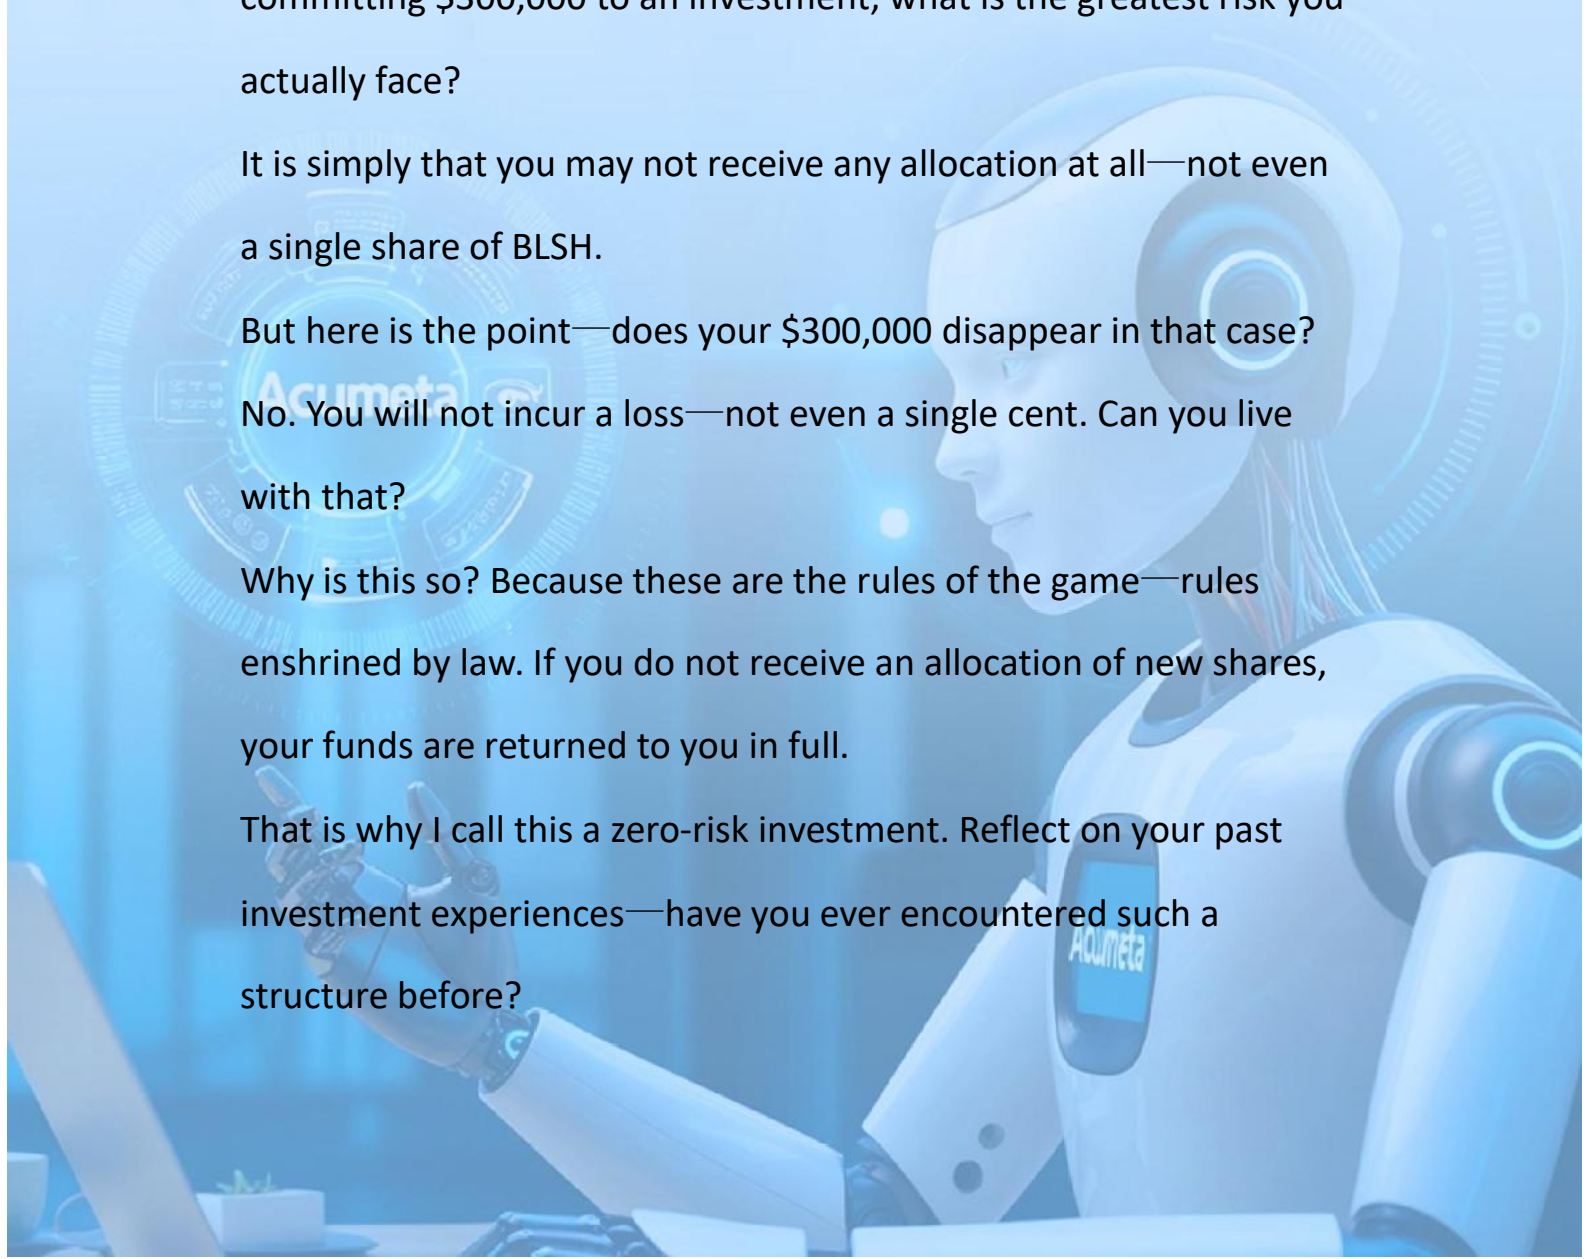

What is most reassuring is this: while it may appear that you are committing \$300,000 to an investment, what is the greatest risk you actually face?

It is simply that you may not receive any allocation at all—not even a single share of BLSH.

But here is the point—does your \$300,000 disappear in that case? No. You will not incur a loss—not even a single cent. Can you live with that?

Why is this so? Because these are the rules of the game—rules enshrined by law. If you do not receive an allocation of new shares, your funds are returned to you in full.

That is why I call this a zero-risk investment. Reflect on your past investment experiences—have you ever encountered such a structure before?

If not, perhaps it is worth considering how rare and valuable such an opportunity truly is.

The success of BLSH's subscription experience not only inspires us with insights into achieving wealth through strategic allocation.

It also offers further lessons—what should we take away?

As a successfully listed cryptocurrency exchange, it provides constructive guidance for the evaluation of our Quantitative Think Tank Center token, FGT.

Looking back on the development of cryptocurrency exchanges in the U.S.:

The earliest American cryptocurrency exchanges resembled garage-born tech startups—few licenses, minimal regulation. At the time, public perception was much like the view of the Gold Rush: a mixture of curiosity, opportunity, and skepticism.

From 2017 to 2021, the period could be called a “bull market carnival.”

Coinbase rang the Nasdaq opening bell, and finally, Wall Street's old money acknowledged that crypto was no longer an “underground bar” but a legitimate part of Financial Main Street.

Today, U.S. cryptocurrency exchanges are no longer the “hacker

hangouts” of the past. They hold regulatory licenses, maintain proof of reserves, employ risk management teams, and even deploy AI-driven high-frequency trading algorithms and auditing processes. Their security and transparency often surpass those of many traditional brokerages.

Moreover, with the approval of Bitcoin ETFs and Ethereum staking products entering the mainstream, crypto exchanges are evolving from a mere “alternative investment channel” into an essential component of asset allocation.

The history of U.S. cryptocurrency exchanges is a story of transformation—from the Wild West to Wall Street. It is a narrative filled with twists, yet brimming with hope.

You may not know how high the next BTC / ETH will climb, but one thing is certain: as long as the market exists, there will always be business in trading.

It is precisely because of the pioneers who bravely embraced regulation that cryptocurrencies have achieved legitimate status today.

And we, as witnesses and participants in this historic transformation, now stand before an unprecedented opportunity.

As the chart shows, my Quantitative Think Tank Center token: FGT has been officially listed on the ETHERMAC cryptocurrency exchange. Despite several years of ongoing trading, I shared this morning why I chose this particular venue.

Using BLSH as a highly representative example of a cryptocurrency exchange successfully listing today, it underscores that compliance is a foundational criterion for the future of crypto trading.

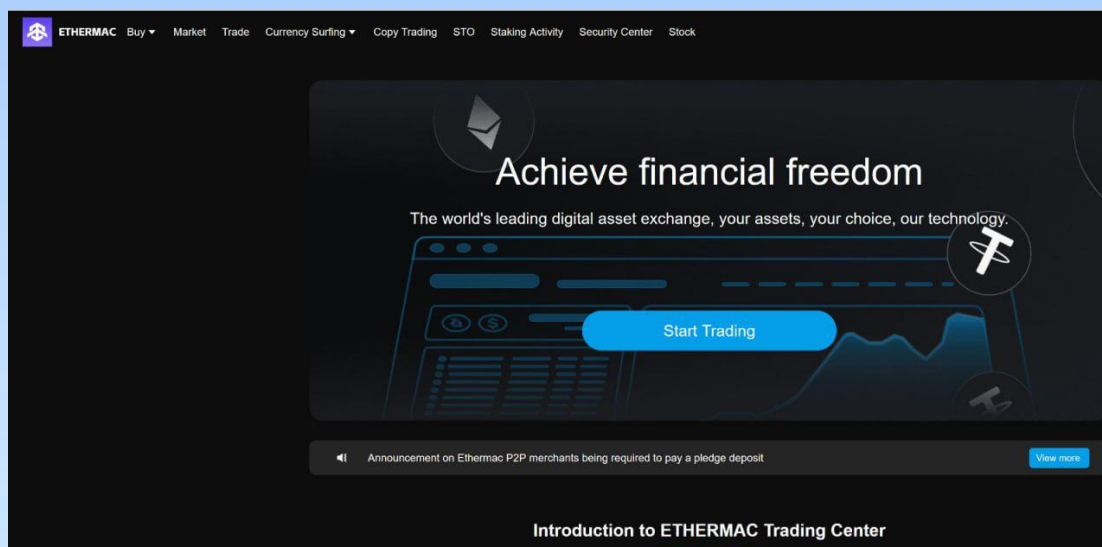

I specifically recognized this critical feature in the ETHERMAC exchange, which is why I entrusted the issuance of my token here.

You should understand: my Quantitative Think Tank Center token is an on-chain asset. It embodies my valuation framework, and that valuation is objectively reflected through its token price.

If I were unable to list, trade, or promote it on a compliant exchange, the future value prospects of both my Quantitative Think Tank Center and the Acumeta quantitative system would face catastrophic setbacks.

But the facts have validated my judgment and choice—this is indeed the right place.

The ETHERMAC cryptocurrency exchange stands out because:

1. It possesses a fully compliant framework, including key MSB regulatory measures, which gave me the confidence to list and circulate my token here.
2. It maintains a proof-of-assets ledger, ensuring that every user's holdings are safeguarded with more than 101% coverage.

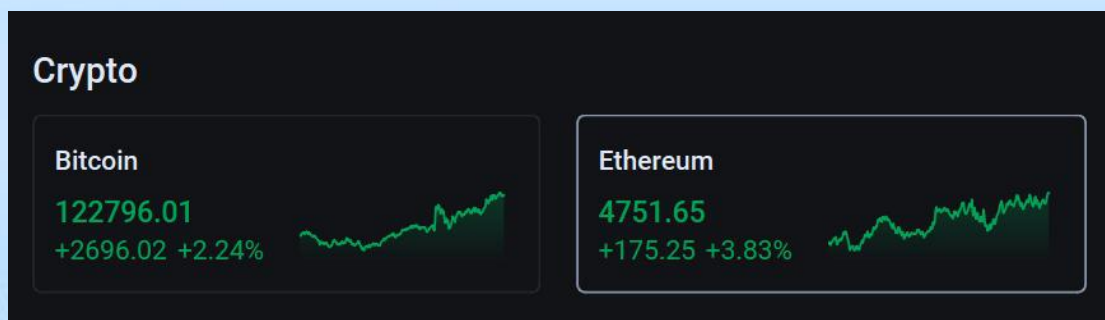

This mechanism functions much like a traditional bank. When you deposit U.S. dollars, and in the rare event the bank fails—think of the recent Silicon Valley Bank collapse—there is a baseline compensation mechanism. In that case, the Federal Deposit Insurance Corporation guarantees up to \$250,000 per account. Similarly, the exchange's proof-of-assets ensures that all user funds are always fully covered, guaranteeing secure capital flows.

3. It offers a diversified investment and trading experience—from crypto spot trading and new token STO issuance to currency surfing, secondary options, new fund launches, and tokenized stock functionality. If you've ever used a Robinhood account, this will be easier to understand.

So, guys, do you understand now?

Do you see why my token—and the token voucher exchange platform in your hands—was placed here?

The success of BLSH demonstrates that the standing of U.S. cryptocurrency exchanges is rising steadily, gaining both prominence and popularity.

From the moment you joined my community program, I have consistently conveyed—and put into practice—the principle of secure investing. Whether you are trading stocks, participating in an IPO subscription, or competing for crypto token reserves, every step reflects this fundamental philosophy.

Secure investing is the foundation, while the pursuit of profit is eternal.

Just look at the BTC / ETH you hold. Do you see your wealth's premium materializing in real terms?

Indeed, today's “Win the Race for Reserve Digital Token Challenge” is far from over. Yet some foresighted participants are already savoring the celebration with champagne in hand. Could that person be you? I sincerely hope so.

Folks, Wednesday's market felt like America's largest Christmas fireworks display—not just a few seconds in the sky, but a continuous cascade that lit up the night until dawn.

BTC surged past \$123,000 in the afternoon, and ETH proudly charged toward its all-time high of \$4,800. This isn't an illusion, nor a fleeting FOMO mirage—it is the tangible reward for your persistent participation over the past months, even years, in the

“Win the Race for Reserve Digital Token Challenge.”

Remember, the rate cut hasn't officially landed yet; this tidal wave of capital is only just beginning. The Fed loosening liquidity is like opening a giant fire hydrant for the market—money gushes forth, and any high-quality, highly liquid, scarce crypto asset gets snatched up as fiercely as Black Friday deals on flat-screen TVs.

Take a moment to feel this—not because the numbers are moving, but because you are standing at a historical juncture, with a wide highway of wealth stretching before you.

Answer questions to earn more token vouchers: submit your answers to my assistant.

1. On which day did you participate in BLSH's subscription, and why did you choose to subscribe?
2. Looking at the BLSH allocation you received today, are these cost advantages the kind of investment outcome you hoped for?
3. Do you know the current market value of the token vouchers in your hand? Would you like to redeem them earlier on Redemption Carnival day?

If we are favored by Providence, trust your choices and stay the course. See you Thursday!
