

# Monday, Aug 11, 2025

Folks—happy Monday, and good to see you here again.

Over the past weekend, the price action of BTC and ETH felt like a full-blown rock concert—hot rhythms, electrifying peaks, and a crowd that simply couldn't get enough. This wasn't just about numbers climbing on a chart; it was a collective triumph of foresight.

Those who built their token reserves early are now reaping the rewards of their strategic positioning.

As we often say, "You snooze, you lose". Miss the moment, and the moment moves on without you.

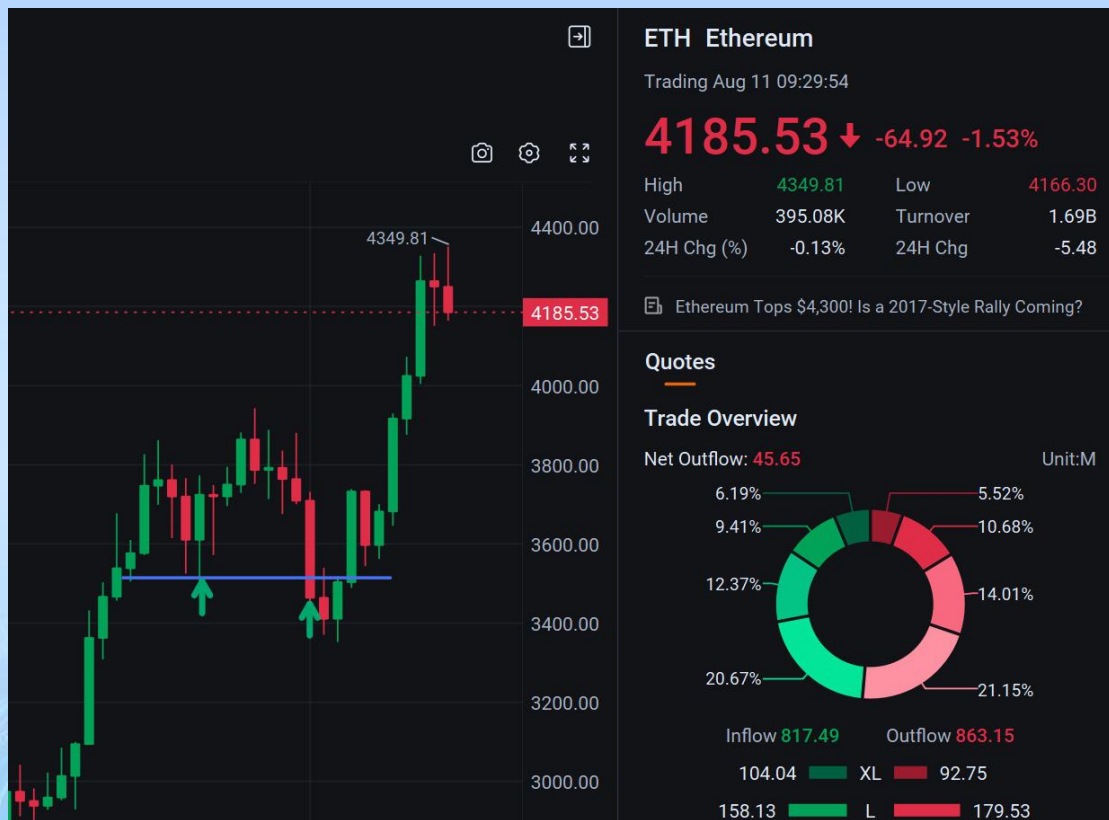

These aren't just price fluctuations—they're a clear, hard-edged reminder that the forward-looking mindset behind the Win the Race for Reserve Digital Token Challenge has already translated into tangible results. The ones who committed early, who placed their bets before the wind direction was obvious, are now enjoying the

# FinLogic

dividends of conviction.

So why let an opportunity this obvious slip by? It's like standing on the riverbank during a gold rush, watching others pull nuggets from the water, yet refusing to wade in yourself.

When institutions keep channeling capital into BTC and ETH, what does that really signify?

It's as if the “big players” on Wall Street have finally extended an invitation for cryptocurrency to join their club. No longer dismissed as a passing joke, it's now regarded as a serious asset class—a tool capable of delivering substantial value to their clients.

This marks a shift in the crypto market's identity: from speculation to investment, from unruly growth to mainstream acceptance. Their

entry brings more than just capital; it brings credibility, stability, and maturity.

And now, our upcoming FGT Token Redemption Carnival is set to be a centerpiece of this global crypto celebration—created exclusively for our community.

Have you secured that coveted reservation card?

“Make hay while the sun shines.” It's the reminder to seize a moment when it's here and make the most of it.

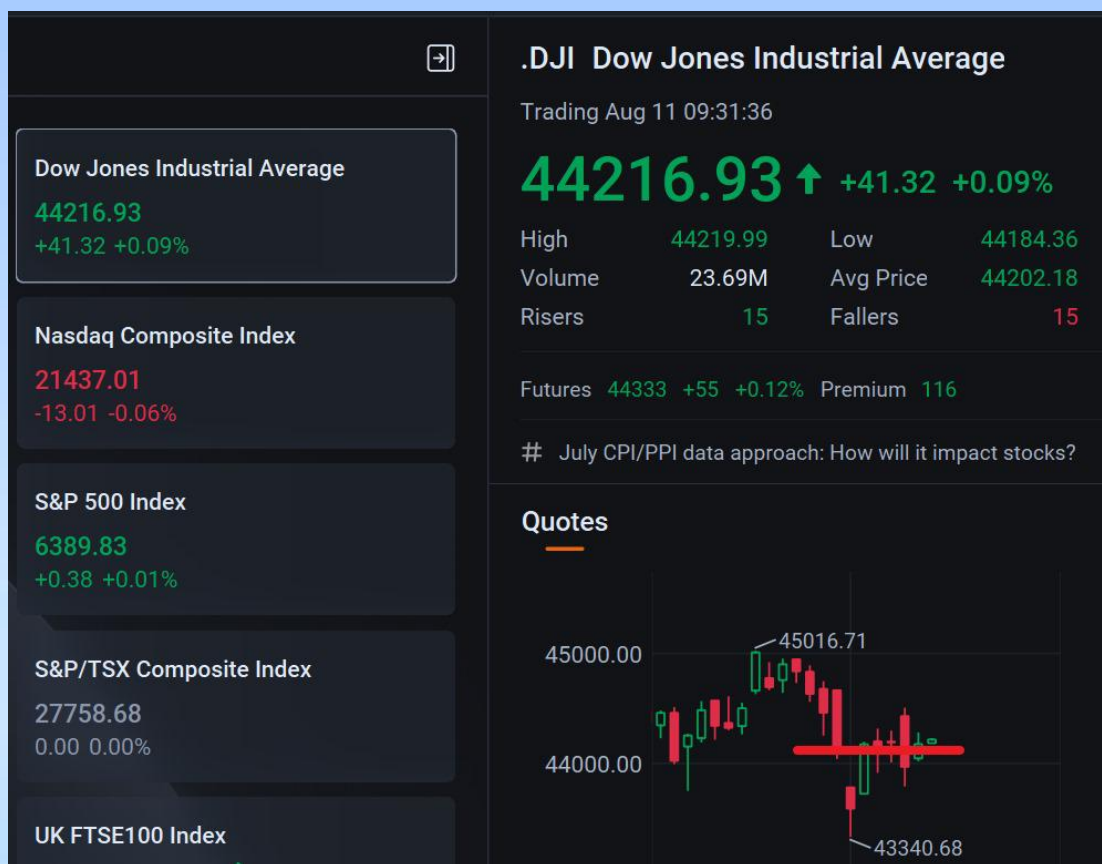

Right now, the sun over the crypto world is blazing high.

Institutional capital is pouring in like rich fertilizer onto fertile soil—accelerating growth, strengthening the crop. And our Token Redemption Carnival is that moment of harvest.

So, guys, don't be the one standing on the riverbank, just watching. Don't let hesitation and second-guessing cost you a place in this historic wealth cycle. This is a global crypto festival—on-chain and off-chain players alike are turning up the volume, quickening the pace, waiting for the countdown to strike zero.

Picture it: when capital, technology, and creativity from across the globe collide in the same instant, the “fireworks of wealth” that ignite will be nothing short of spectacular.

Bring your initiative, and the next person under the spotlight could

Looking back at Monday's market outlook, ask yourself: over the past week—or even the past month—what decisions have you made that genuinely worked to your advantage?

The three major U.S. equity indices are showing sustained upward momentum from elevated levels. But does that trajectory conceal certain vulnerabilities?

Consider the sharp surprise in the August 1 nonfarm payroll data. After two consecutive days of pullback, the market spent the following week in a gradual recovery. Around the 6,400-point mark, however, I saw a different picture emerge.

First, the DJIA has yet to fully recover. The RUT remains short of a

complete rebound as well. This suggests that the Nasdaq and S&P 500's recovery has been largely driven by the Q2 earnings strength of the “Magnificent Seven.” Their robust performance has drawn concentrated capital and attention, but the reality is that many other sectors have seen little meaningful recovery. That, in itself, is one of the market's underlying risks.

The U.S. stock market is still in a structurally driven phase led mainly by AI infrastructure and AI application segments, while industries sensitive to inflation or tariffs remain weak. When choosing stocks and making trades, it's important to keep a strong focus on risk protection.

At the same time, most companies' Q2 earnings reports were solid, yet their gains were limited. According to Acumeta's big-data analysis, the increases were lower than the average over the past five years, while the declines for companies that missed expectations were considerably larger—well above the five-year average.

What does this indicate?

It shows that Q3 performance guidance plays a major role. Apart from the tech and AI sectors, where guidance has exceeded expectations, most other industries have been relatively

conservative—a point we can verify through familiar stocks such as APP / DUOL / SOUN.

This week's key economic data—Tuesday's CPI release and Thursday's PPI report—will provide critical guidance for the Federal Reserve's final decision on a September rate cut.

Against the backdrop of a sharp downside surprise in the nonfarm payroll data, any uptick in inflation would be a dangerous signal.

Rising inflation, coupled with weaker-than-expected employment and a higher unemployment rate, points toward an economy sliding into recession. For equities, that would be a heavy blow. In such a scenario, even if the Fed ultimately cuts rates, it would only confirm that the economic fundamentals have deteriorated materially.

Long-term capital would likely reduce equity exposure and shift toward cash.

Adding to this, the uncertainty surrounding potential U.S. – Russia negotiations carries its own risk—one that, if triggered, would be rapidly priced into the market.

For this reason, the rise in market volatility and risk factors at the start of this week is fully in line with my earlier assessment: mid-to-early August presents more opportunity, late August brings a higher concentration of potential risks, and September is the period

most likely to face severe challenges .

At Monday's opening, we saw the VIX spike sharply higher, a clear and immediate reflection of the market's expectations for the week ahead.

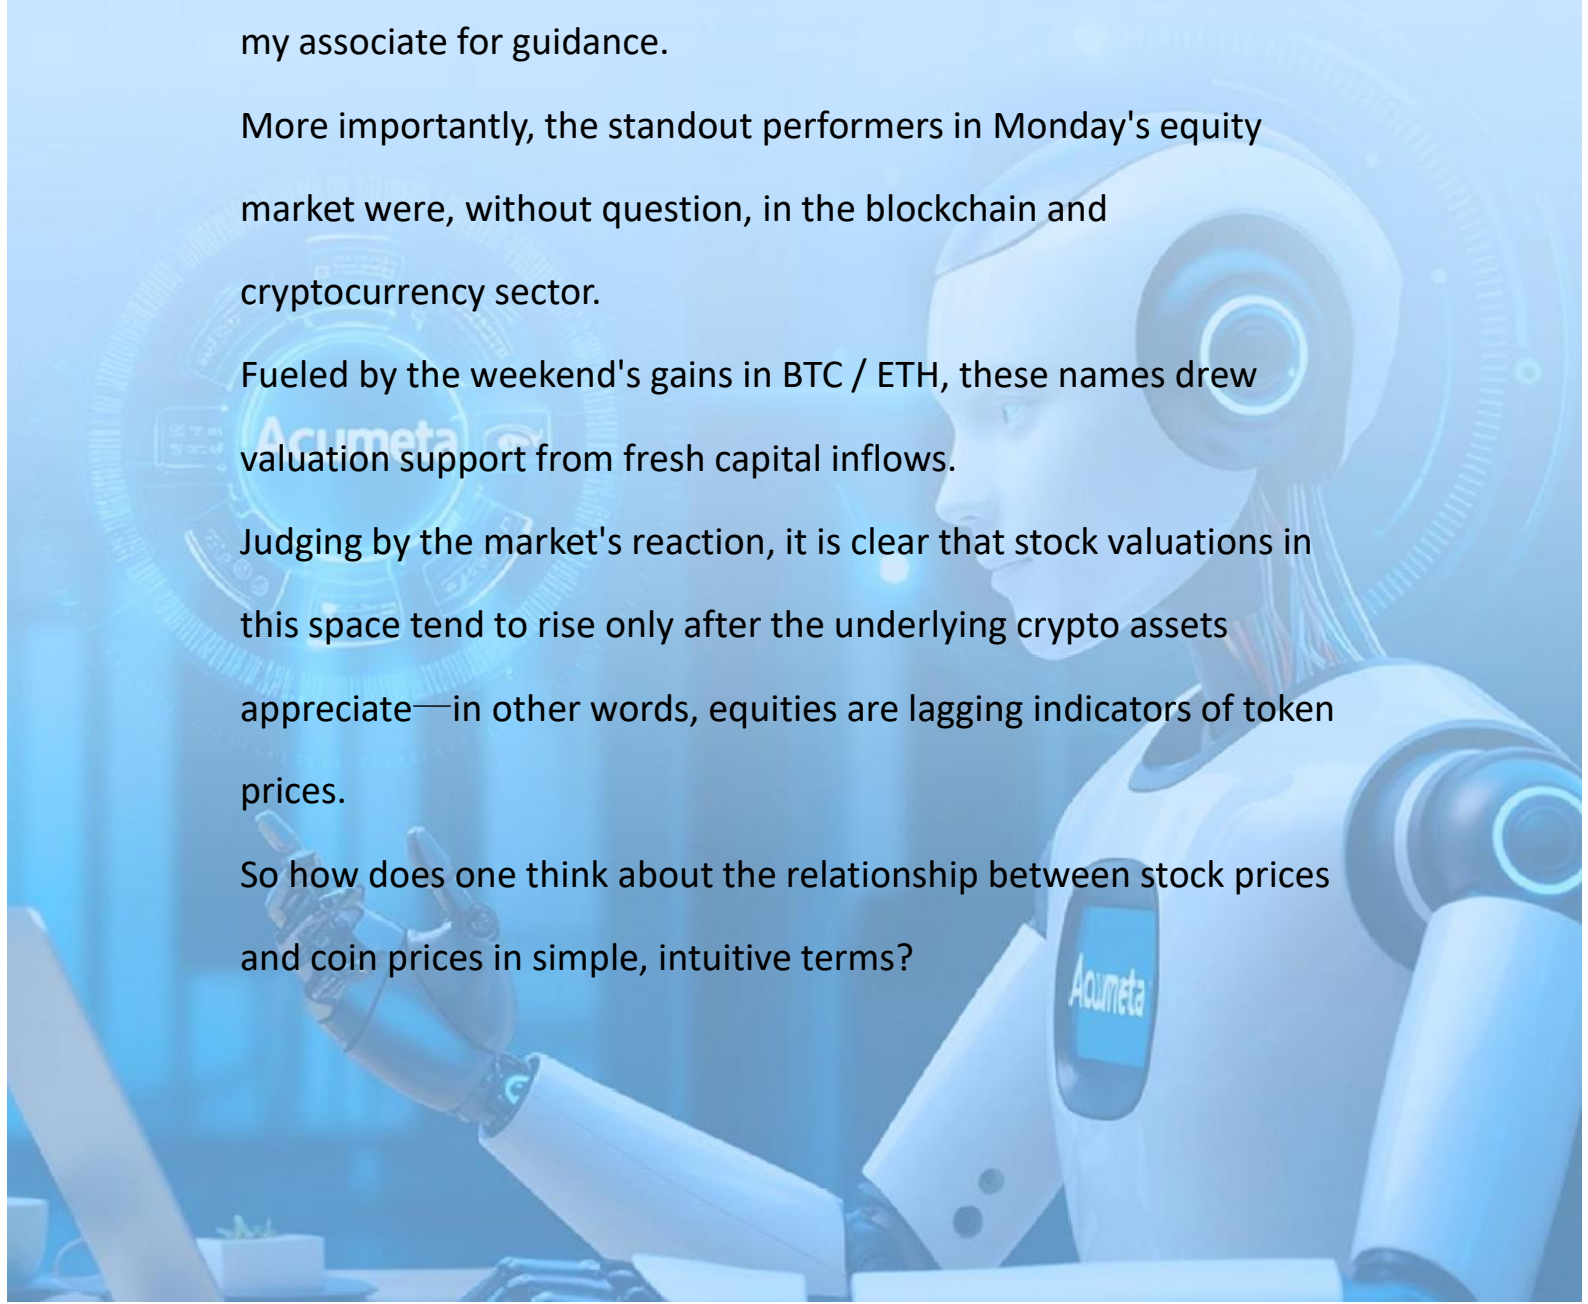

From a hedging perspective, my quantitative strategy portfolio is well-positioned to execute such pricing trades. That said, these hedges are inherently short-term in nature; if you're not familiar with how to manage them, I would strongly suggest reaching out to my associate for guidance.

More importantly, the standout performers in Monday's equity market were, without question, in the blockchain and cryptocurrency sector.

Fueled by the weekend's gains in BTC / ETH, these names drew valuation support from fresh capital inflows.

Judging by the market's reaction, it is clear that stock valuations in this space tend to rise only after the underlying crypto assets appreciate—in other words, equities are lagging indicators of token prices.

So how does one think about the relationship between stock prices and coin prices in simple, intuitive terms?

Over the weekend, the former president's son remarked—rather bluntly—that watching today's ETH short sellers get crushed was deeply satisfying.

His advice was simple: stop shorting BTC / ETH, or you will be run over.

The tone may have been dramatic, but it underscored a genuine point—the market is showing signs of a potential breakout.

Take MTSR as an example. It holds the largest Bitcoin reserve among publicly traded companies worldwide—nearly 600,000 coins.

The firm has financed these acquisitions largely through secondary equity offerings and convertible debt, steadily adding to its reserves over time.

This means that when the price of Bitcoin it holds rises—as it did through early Monday morning, reaching \$122k—the company's equity valuation is naturally marked higher in pre-market trading,

often leading to an opening gap to the upside.

In short, the stock's upward movement is entirely predicated on the appreciation of the assets it holds—a straightforward but powerful valuation logic.

When a company holds crypto assets, they function much like reserves on its balance sheet.

As the price of BTC / ETH rises, the dollar value of those reserves increases in parallel, thereby expanding the company's net asset position.

Market expectations then drive equity prices.

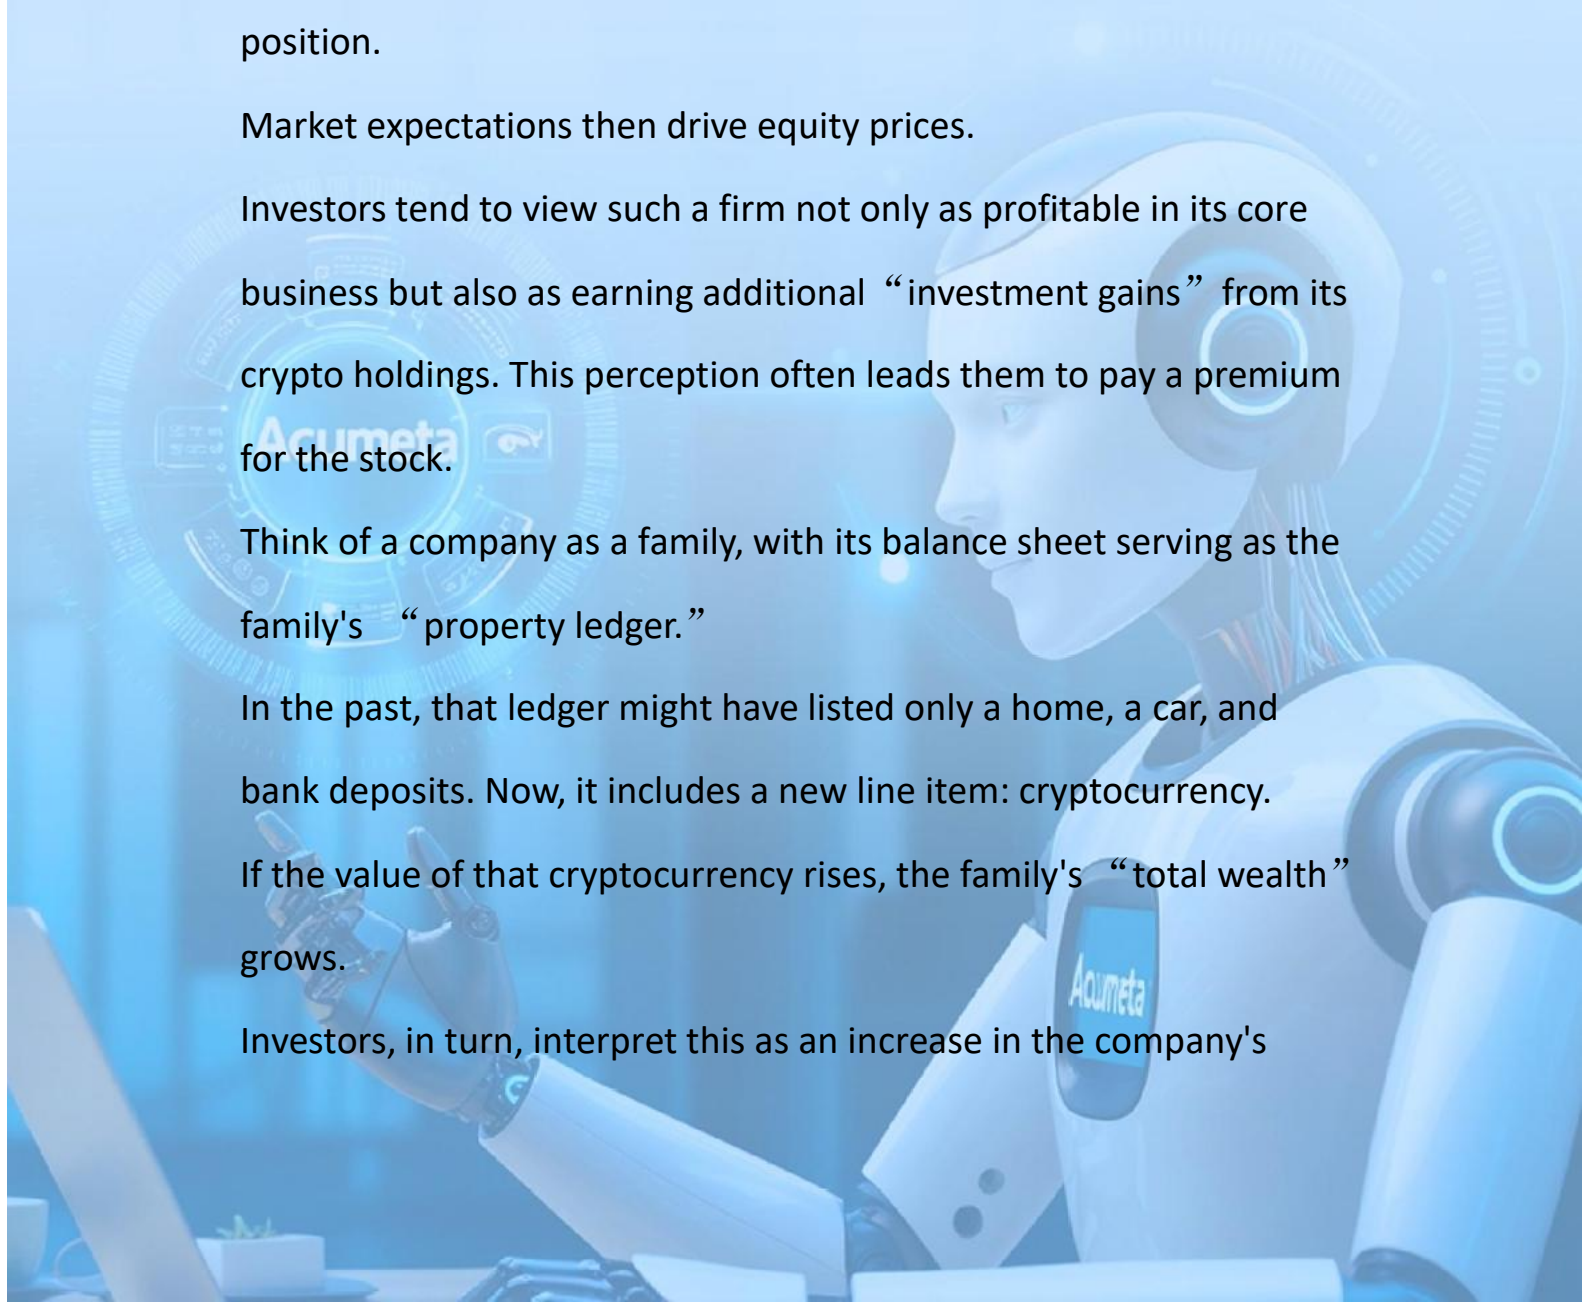

Investors tend to view such a firm not only as profitable in its core business but also as earning additional “investment gains” from its crypto holdings. This perception often leads them to pay a premium for the stock.

Think of a company as a family, with its balance sheet serving as the family's “property ledger.”

In the past, that ledger might have listed only a home, a car, and bank deposits. Now, it includes a new line item: cryptocurrency.

If the value of that cryptocurrency rises, the family's “total wealth” grows.

Investors, in turn, interpret this as an increase in the company's

intrinsic value—prompting them to pay more for its shares, which in turn drives the stock price higher.

From this, we can infer that among Monday's standout performers in the crypto and blockchain space:

MSTR's rise was propelled by the increase in BTC's price.

BMNR's stock climbed alongside ETH's price appreciation.

Meanwhile, MP's gains were driven by rising rare earth mineral prices.

However, stock prices and market caps are influenced by a range of additional factors beyond the underlying asset values. So the most

# FinLogic

straightforward approach is to own the assets held by these public companies directly.

Assets that companies acquire can often be purchased by individual investors as well. Clearly, you can't easily buy MP's rare earth minerals outright—it's either impossible or highly impractical.

But owning BTC and ETH is much simpler.

All you need is a wallet and an account on a reputable crypto exchange. If you haven't found a trustworthy platform yet, please reach out to my assistant for assistance.

Direct ownership of crypto assets has become the best choice in today's landscape.

Whether you opt for BTC / ETH / USDC, or any other token—you can fully own them outright.

What does direct ownership of crypto assets really mean?

It means financial freedom—an experience enabled by blockchain

technology, where the assets genuinely belong to you. This is ownership expressed on-chain.

It means decentralization—only you control it and decide how it moves.

When you deposit money in a bank, in essence, you're lending money to the bank, which pays you interest in return.

But today, by holding cryptocurrency, you truly own your assets and benefit from their premium. Do you like that arrangement?

In 2025, the most potent expression of wealth is direct ownership of crypto spot assets.

Indeed, this may be the most defining, brilliant decision you make in your lifetime.

Reflecting on my "Win the Race for Reserve Digital Token Challenge," which runs through August 31—three weeks have passed since its launch. May I ask, how many reserve tokens have

If your token reserves fall short, do you feel a sense of regret?

Take ETH as an example:

When it was at \$3,600, I told you it was a prime opportunity.

At \$3,500, I said this was ETH's best opening for you.

When it dipped below \$3,500, I called it a wealth window opened by providence.

As it happens, over the weekend ETH climbed above \$4,300—have you reaped the rewards of your reserve race?

Results speak silently. They reflect your capacity for decisive action.

Every shot Michael Jordan took, every basket made, stood for relentless, almost devilish practice.

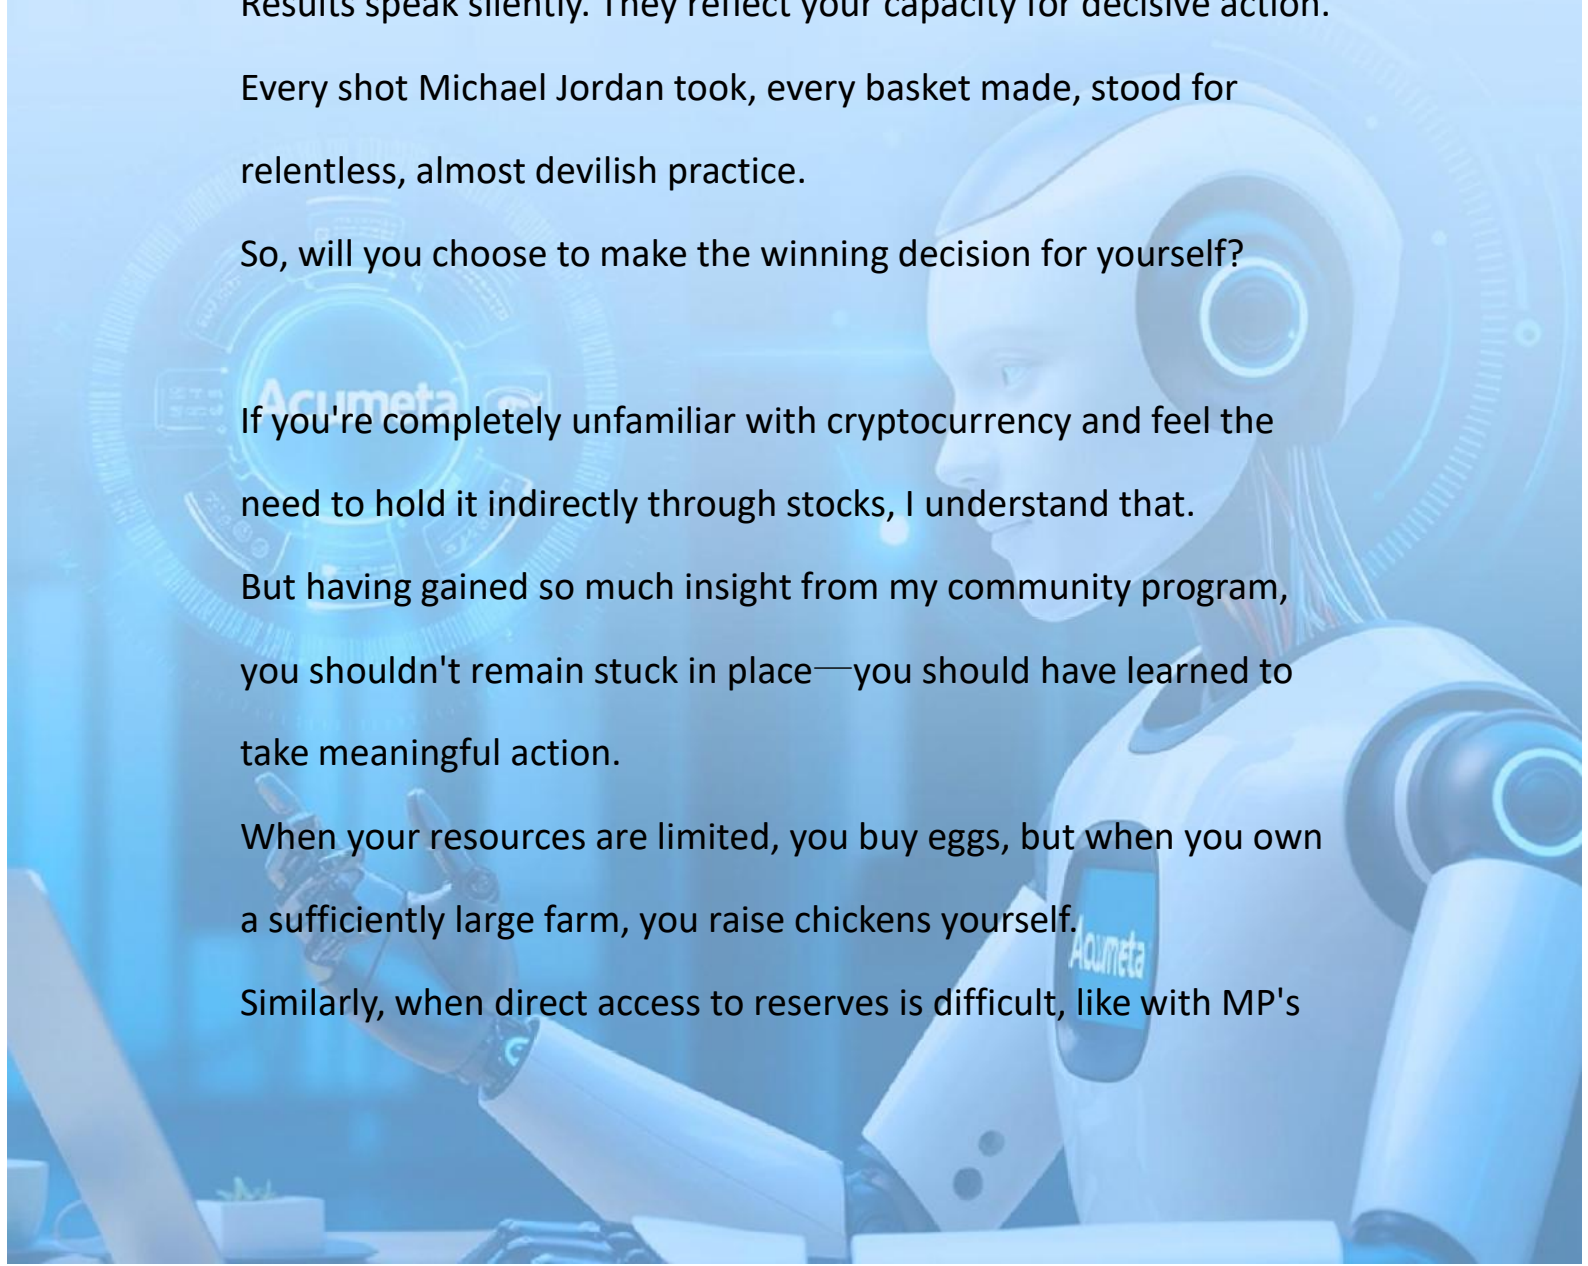

So, will you choose to make the winning decision for yourself?

If you're completely unfamiliar with cryptocurrency and feel the need to hold it indirectly through stocks, I understand that.

But having gained so much insight from my community program, you shouldn't remain stuck in place—you should have learned to take meaningful action.

When your resources are limited, you buy eggs, but when you own a sufficiently large farm, you raise chickens yourself.

Similarly, when direct access to reserves is difficult, like with MP's

rise reflecting increasing rare earth mineral prices, it's tough to hold those minerals yourself.

Cryptocurrency, however, requires only a wallet and an account where you can purchase it. You can easily convert your cash into stablecoins like USDC or into BTC and ETH.

It's secure, reliable, and globally accessible.

The U.S. government holds crypto this way, as does BlackRock—the world's largest asset manager—and publicly traded companies.

You're not the only holder, but you can certainly be a beneficiary too.

The stock market's response to rate cuts isn't guaranteed—it largely depends on how much economic deterioration is anticipated.

Cryptocurrencies, on the other hand, stand to benefit fully from rate reductions. When the Fed cuts rates, the circulating supply of dollars increases, and through a straightforward mechanism, crypto readily absorbs this influx, driving prices upward.

This is precisely the right move to make on the eve of a rate cut.

Whether or not you choose to act, the national trend is clear—holding reserves of BTC / ETH is no longer novel. Yet inevitably, some will miss out and become the protagonists of “the one that got away” stories. What I truly hope is that you won't be one of

In my sessions, I have continuously provided in-depth analysis and updates on CRCL, with the genuine goal of helping you fully grasp the significance and forward-looking value of USDC.

On Monday, the stock surged again, signaling that as BTC / ETH prices steadily climb, the market's demand for stablecoins like USDC will grow accordingly—much like how rising beef and milk prices at the supermarket require more dollars to make a purchase.

Therefore, the expansion of USDC issuance isn't just driven by strategic demand from U.S. Treasury buyers; it also reflects the market's burning enthusiasm.

This is a process—not something that explodes by midday, nor a wealth-class leap achieved overnight.

What I emphasize is that you must do the right things: accumulate the right on-chain assets, diversify your wealth, and nurture future potential—think of it like the nation investing in your retirement fund.

For sure, the risk factors I assess for these stocks pertain to a specific future timeframe. To avoid unnecessary trades, I focus on refining the trading rules within the optimized portfolio.

Please carefully follow the new trading guidance based on the quantitative strategy mix below:

Many stocks have recently rallied on solid Q2 earnings reports. If you've completed those trades and built up cash reserves, here's the plan:

1. Allocate 30% of your funds to the Win the Race for Reserve Digital Token Challenge;
2. Allocate 10% to maintain your current holdings in crypto stocks like CRCL and HOOD;
3. Allocate 50% to aggressively participate in IPO subscriptions—indeed, the subscription phase offers unbeatable profits and a zero-risk trading opportunity;
4. Keep the remaining 10% as liquid capital to hedge against trading risks.

By consistently executing this optimized trading approach, you position yourself to achieve further wealth appreciation in Q3. Can you follow?

Monday's highlight in the U.S. stock market centered on the cryptocurrency sector—where only those with the first-mover advantage stand to build real wealth.

Those who jump in late, chasing sentiment and hype after a spike,

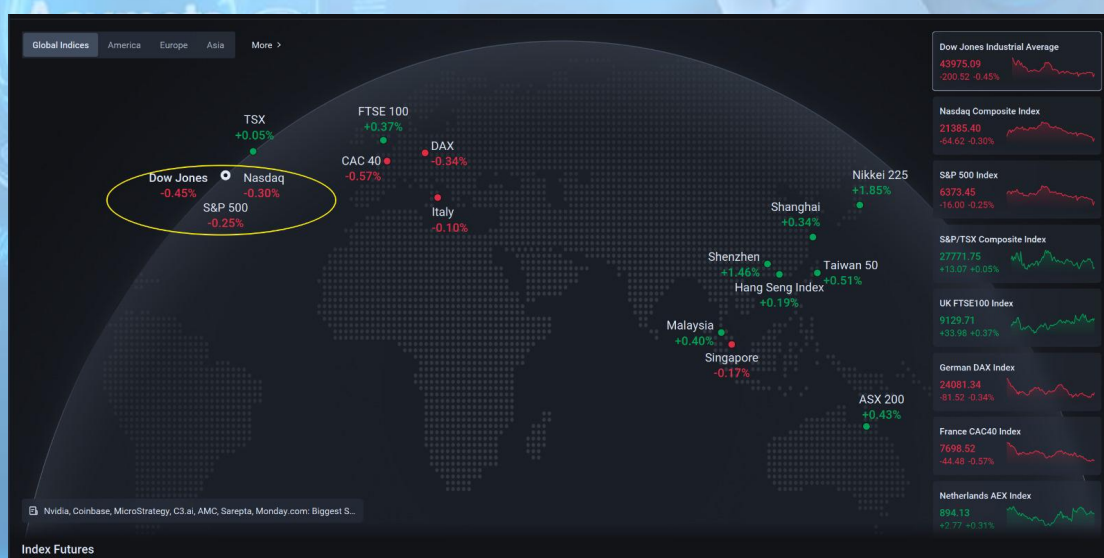

often find themselves stuck holding mediocre, negative emotions.

Folks, that's exactly why my session exists: to help you avoid those pitfalls. The quantitative strategies I share aim to provide forward-looking, high-value decision-making. If over the past month or two you've clearly seen this work, then you shouldn't stop now. You know Acumeta's ultra-smart quant system is constantly optimizing and evolving. And the gains you reap are built on our solid reputation and approachable brand ethos.

Today's best trade remains the IPO subscription for BLSH. If you hold multiple brokerage accounts, you can increase your chances of securing an allocation.

Here's hoping your Monday finds moments of trading passion and joy amid a market that's teetering and seemingly cooling off. Catch you this afternoon!

Good afternoon, folks—hope your Monday is going well.

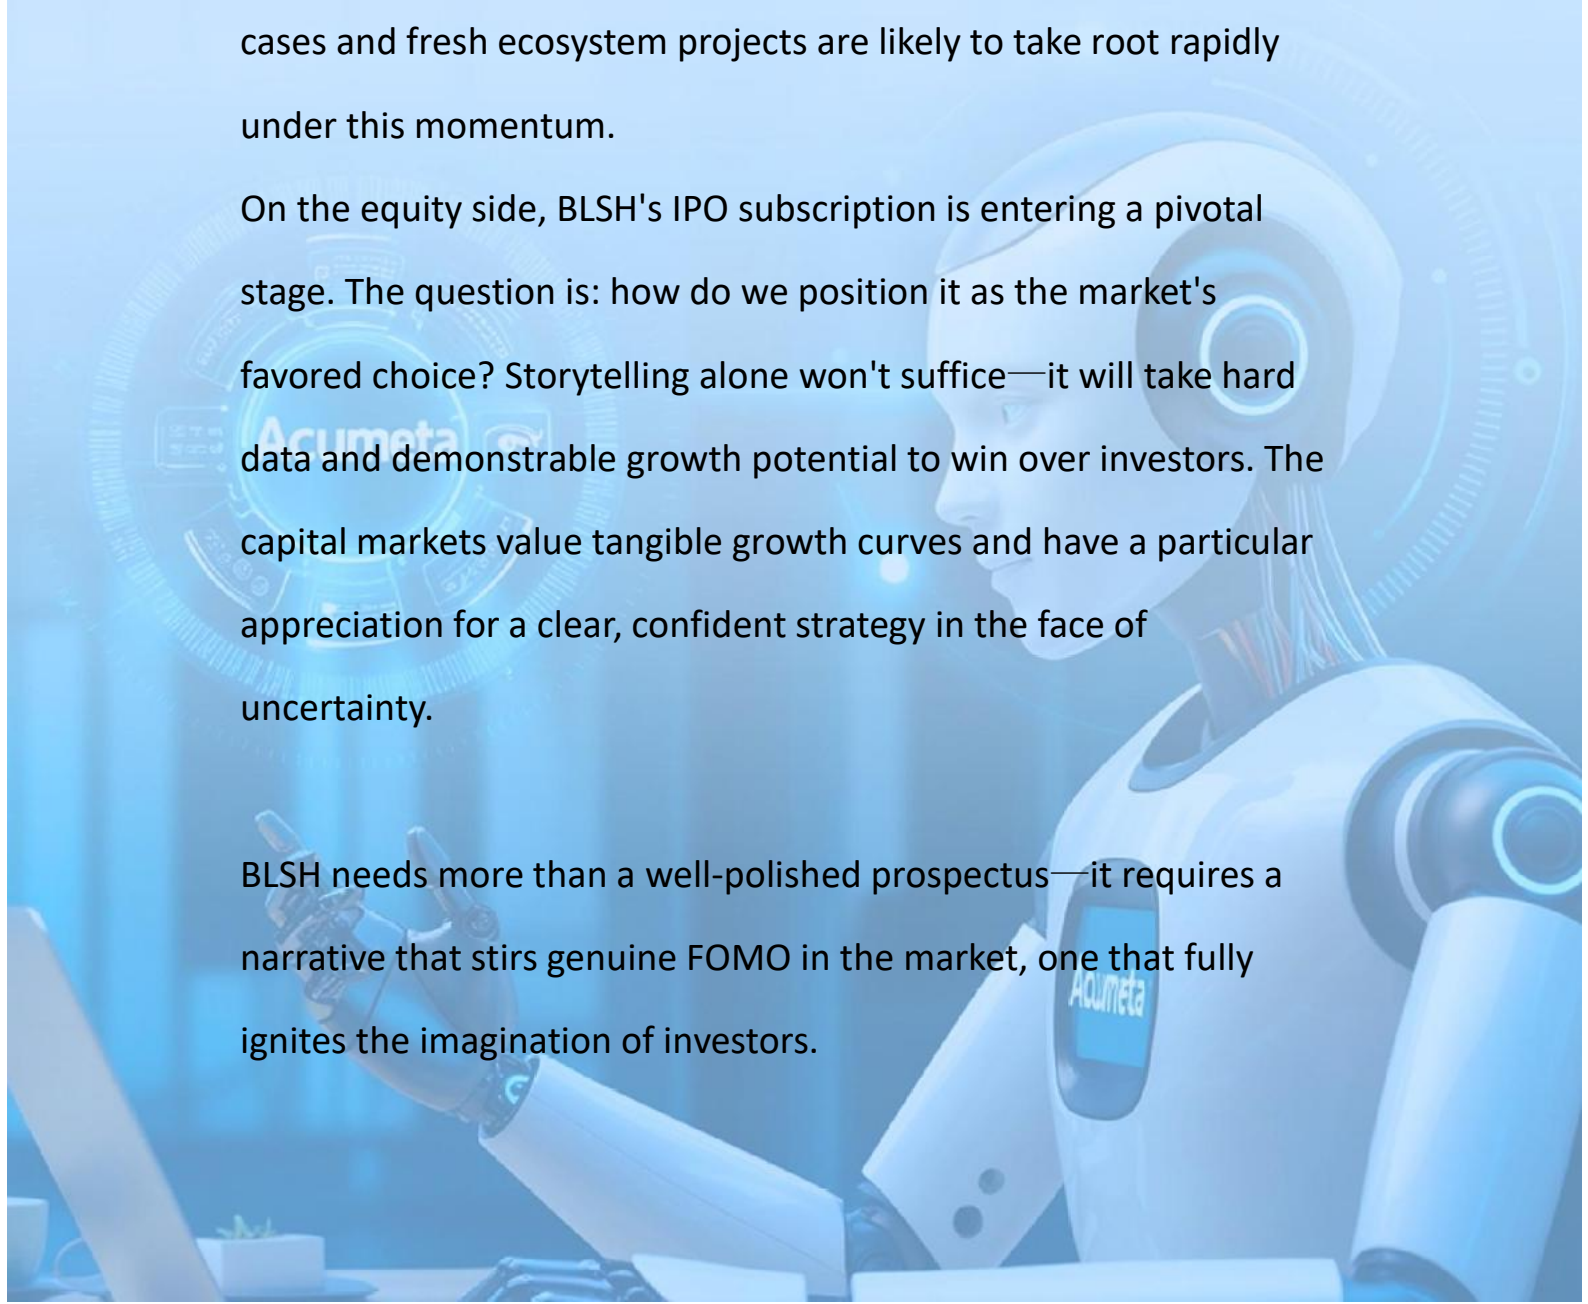

While today's markets are showing a touch of Monday lethargy, it hardly comes as a surprise. Acumeta has once again delivered a firm, precise forward-looking outlook—much like an experienced captain charting the course through rough seas.

Meanwhile, over the weekend, Bitcoin surged past \$122,000 and ETH broke above \$4,300. These are not merely fluctuations on a screen; they are the opening notes of a new wave of capital redistribution. At these levels, many institutional investors who had been sitting on the sidelines will be compelled to step in. New use cases and fresh ecosystem projects are likely to take root rapidly under this momentum.

On the equity side, BLSH's IPO subscription is entering a pivotal stage. The question is: how do we position it as the market's favored choice? Storytelling alone won't suffice—it will take hard data and demonstrable growth potential to win over investors. The capital markets value tangible growth curves and have a particular appreciation for a clear, confident strategy in the face of uncertainty.

BLSH needs more than a well-polished prospectus—it requires a narrative that stirs genuine FOMO in the market, one that fully ignites the imagination of investors.

Guys, today's market feels like a jazz performance—low, steady notes weaving into sudden bursts of crescendo. We can't fixate on a single bar or two; we need to understand the rhythm of the entire composition.

Whether you're a devoted believer in crypto or a seasoned veteran of the stock market, when the score of opportunity begins to play, you should already be in the orchestra pit, instrument in hand, ready to join the ensemble.

So, let's keep our eyes on the prize—seizing the moment now is the only way to ensure that, when the next wave rises, you're standing center stage rather than clapping from the audience.

The three major indexes slipped today, very much as I had anticipated.

But as expected, this is not a moment for despair—it is a moment to reaffirm the value of foresight. Once again, Acumeta has delivered firm guidance, helping us navigate through the market's haze. It is much like steering through a storm: while every other

vessel is pitching in the swells, we can rely on a precise chart to hold our course steady.

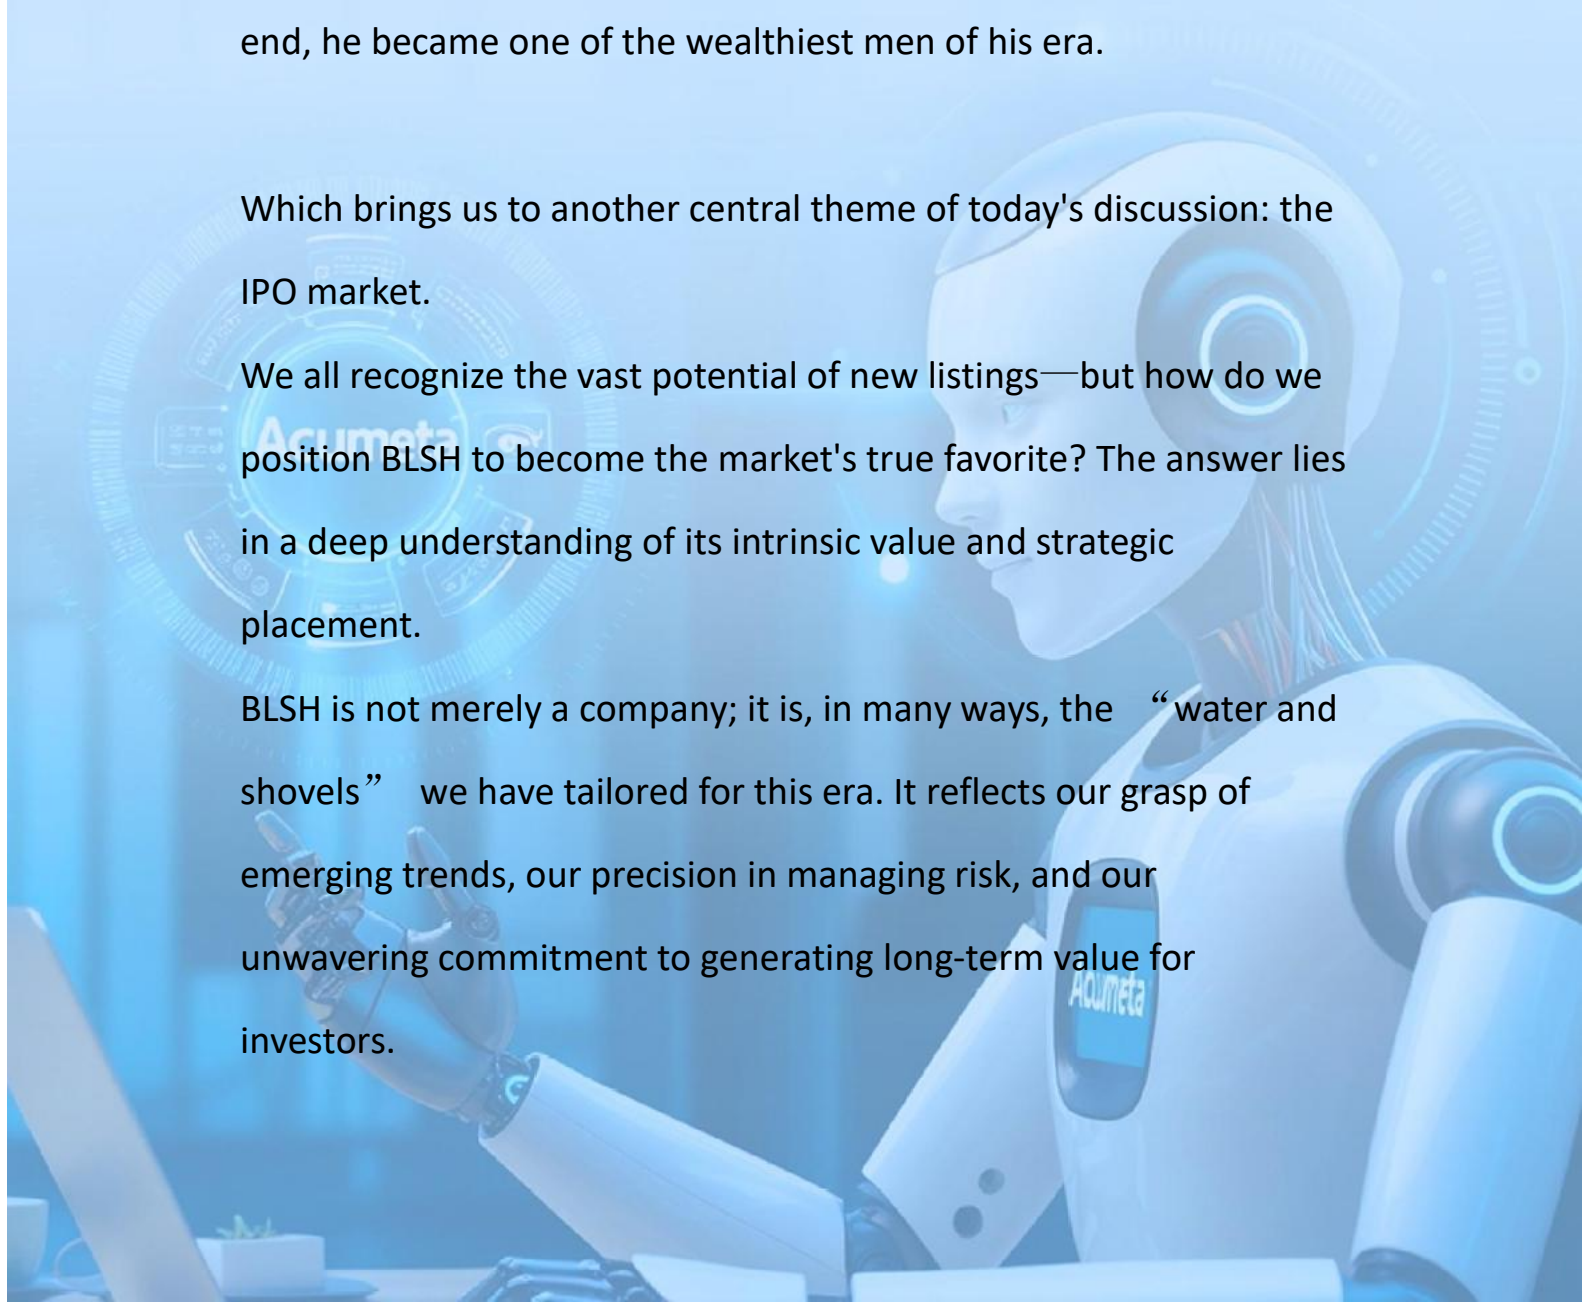

History remains our most instructive teacher. Consider a story from America's Gold Rush.

When throngs of people rushed to California, panning the rivers for gold, one man saw a different kind of opportunity. He did not mine for gold; instead, he opened a store selling water and shovels. He understood something fundamental—gold seekers might leave empty-handed, but they would always need water and tools. In the end, he became one of the wealthiest men of his era.

Which brings us to another central theme of today's discussion: the IPO market.

We all recognize the vast potential of new listings—but how do we position BLSH to become the market's true favorite? The answer lies in a deep understanding of its intrinsic value and strategic placement.

BLSH is not merely a company; it is, in many ways, the “water and shovels” we have tailored for this era. It reflects our grasp of emerging trends, our precision in managing risk, and our unwavering commitment to generating long-term value for investors.

In an age rich with opportunity, it is not enough to be among the gold seekers—one must also be the one supplying the water and the shovels.

My enthusiasm for BLSH's IPO subscription can be explained quite simply:

1. Through the successful execution of multiple IPO projects—CRWV / CRCL / FIG / FIY—I have seen firsthand that allocations secured during the subscription phase, at favorable entry costs, have consistently delivered substantial first-day gains. This is not speculation; it is supported by historical precedent and proven outcomes.
2. Every successful IPO rests on clear competitive advantages. In BLSH's case, the reasons I am confident in its subscription success are straightforward. BLSH (Bullish) is an institutional-focused cryptocurrency exchange that combines the innovation of decentralized finance (DeFi) with the rigor of a regulated framework, delivering fast, reliable crypto trading while also owning the media outlet CoinDesk.

BLSH holds licenses in the U.S., Germany, Hong Kong, and Gibraltar—an asset that not only enables it to operate securely in regulated environments but also strengthens its credibility with partners,

In 2025, the central focus of the crypto world is compliance—every lasting success begins with a foundation of legality and regulatory alignment.

This underscores the significance of the three major crypto bills advanced under President Trump, which strengthened protections for U.S. investors and safeguarded the integrity of trading.

In 2023, BLSH acquired CoinDesk, a leading crypto media outlet—an asset that further cemented its influence and standing within the digital asset sphere. Today, it returns to the arena carrying a triple halo: the leadership of a former NYSE chief, the backing of top-tier Wall Street capital, and the technological muscle of blockchain pioneers. The question is, can it carve out a foothold in a U.S. equities market where Coinbase already holds a commanding lead? On June 17, President Trump signed the Genius Act. Less than two

months later, Bullish filed for its public listing. That is almost certainly no coincidence—it is a textbook display of policy awareness and execution at its finest.

With Farley's regulatory acumen and the long-term backing of Wall Street capital, Bullish entered the market from day one with a “dual-track” strategy, positioning itself firmly at the industry's infrastructure layer—a foundation that underpins the two distinct plays it is now making.

The First Move: Global, Compliant Trading Infrastructure

Where most crypto platforms limit themselves to matching trades, Bullish set out from the start to build a “full-function exchange

engine” —integrating clearing, margin management, liquidity services, risk controls, and, soon, options trading into a single unified system.

This architecture not only enhances stability but also lowers the barriers for institutional clients to participate.

To that end, Bullish has partnered with more than twenty global liquidity providers and quantitative market-making teams, introducing a tiered fee structure to first secure the depth and stability of large-block trading.

The second move: Wall Street capital and the secure data ecosystem.

Bullish's Chairman and CEO, Thomas W. Farley—better known as Tom Farley—once served as President of the NYSE.

Silicon Valley heavyweight and billionaire investor Peter Thiel is also among Bullish's shareholders.

BlackRock and ARK Invest have already subscribed, at the IPO price of \$28 – \$31, to as much as \$200 million worth of common stock.

For someone who has managed the NYSE for five years, what comes next? The answer, it seems, is to dive headfirst into the world of cryptocurrency.

It is precisely the “trading platform + information ecosystem” dual

engine that sets Bullish apart from Coinbase.

Coinbase functions more as a retail gateway to crypto; Binance is the global hub for liquidity.

Bullish's ambition, however, is to become the “Nasdaq of crypto”—integrating trading, clearing, data, and market narrative into one, building a full-stack infrastructure that runs through the entire value chain of the digital asset market.

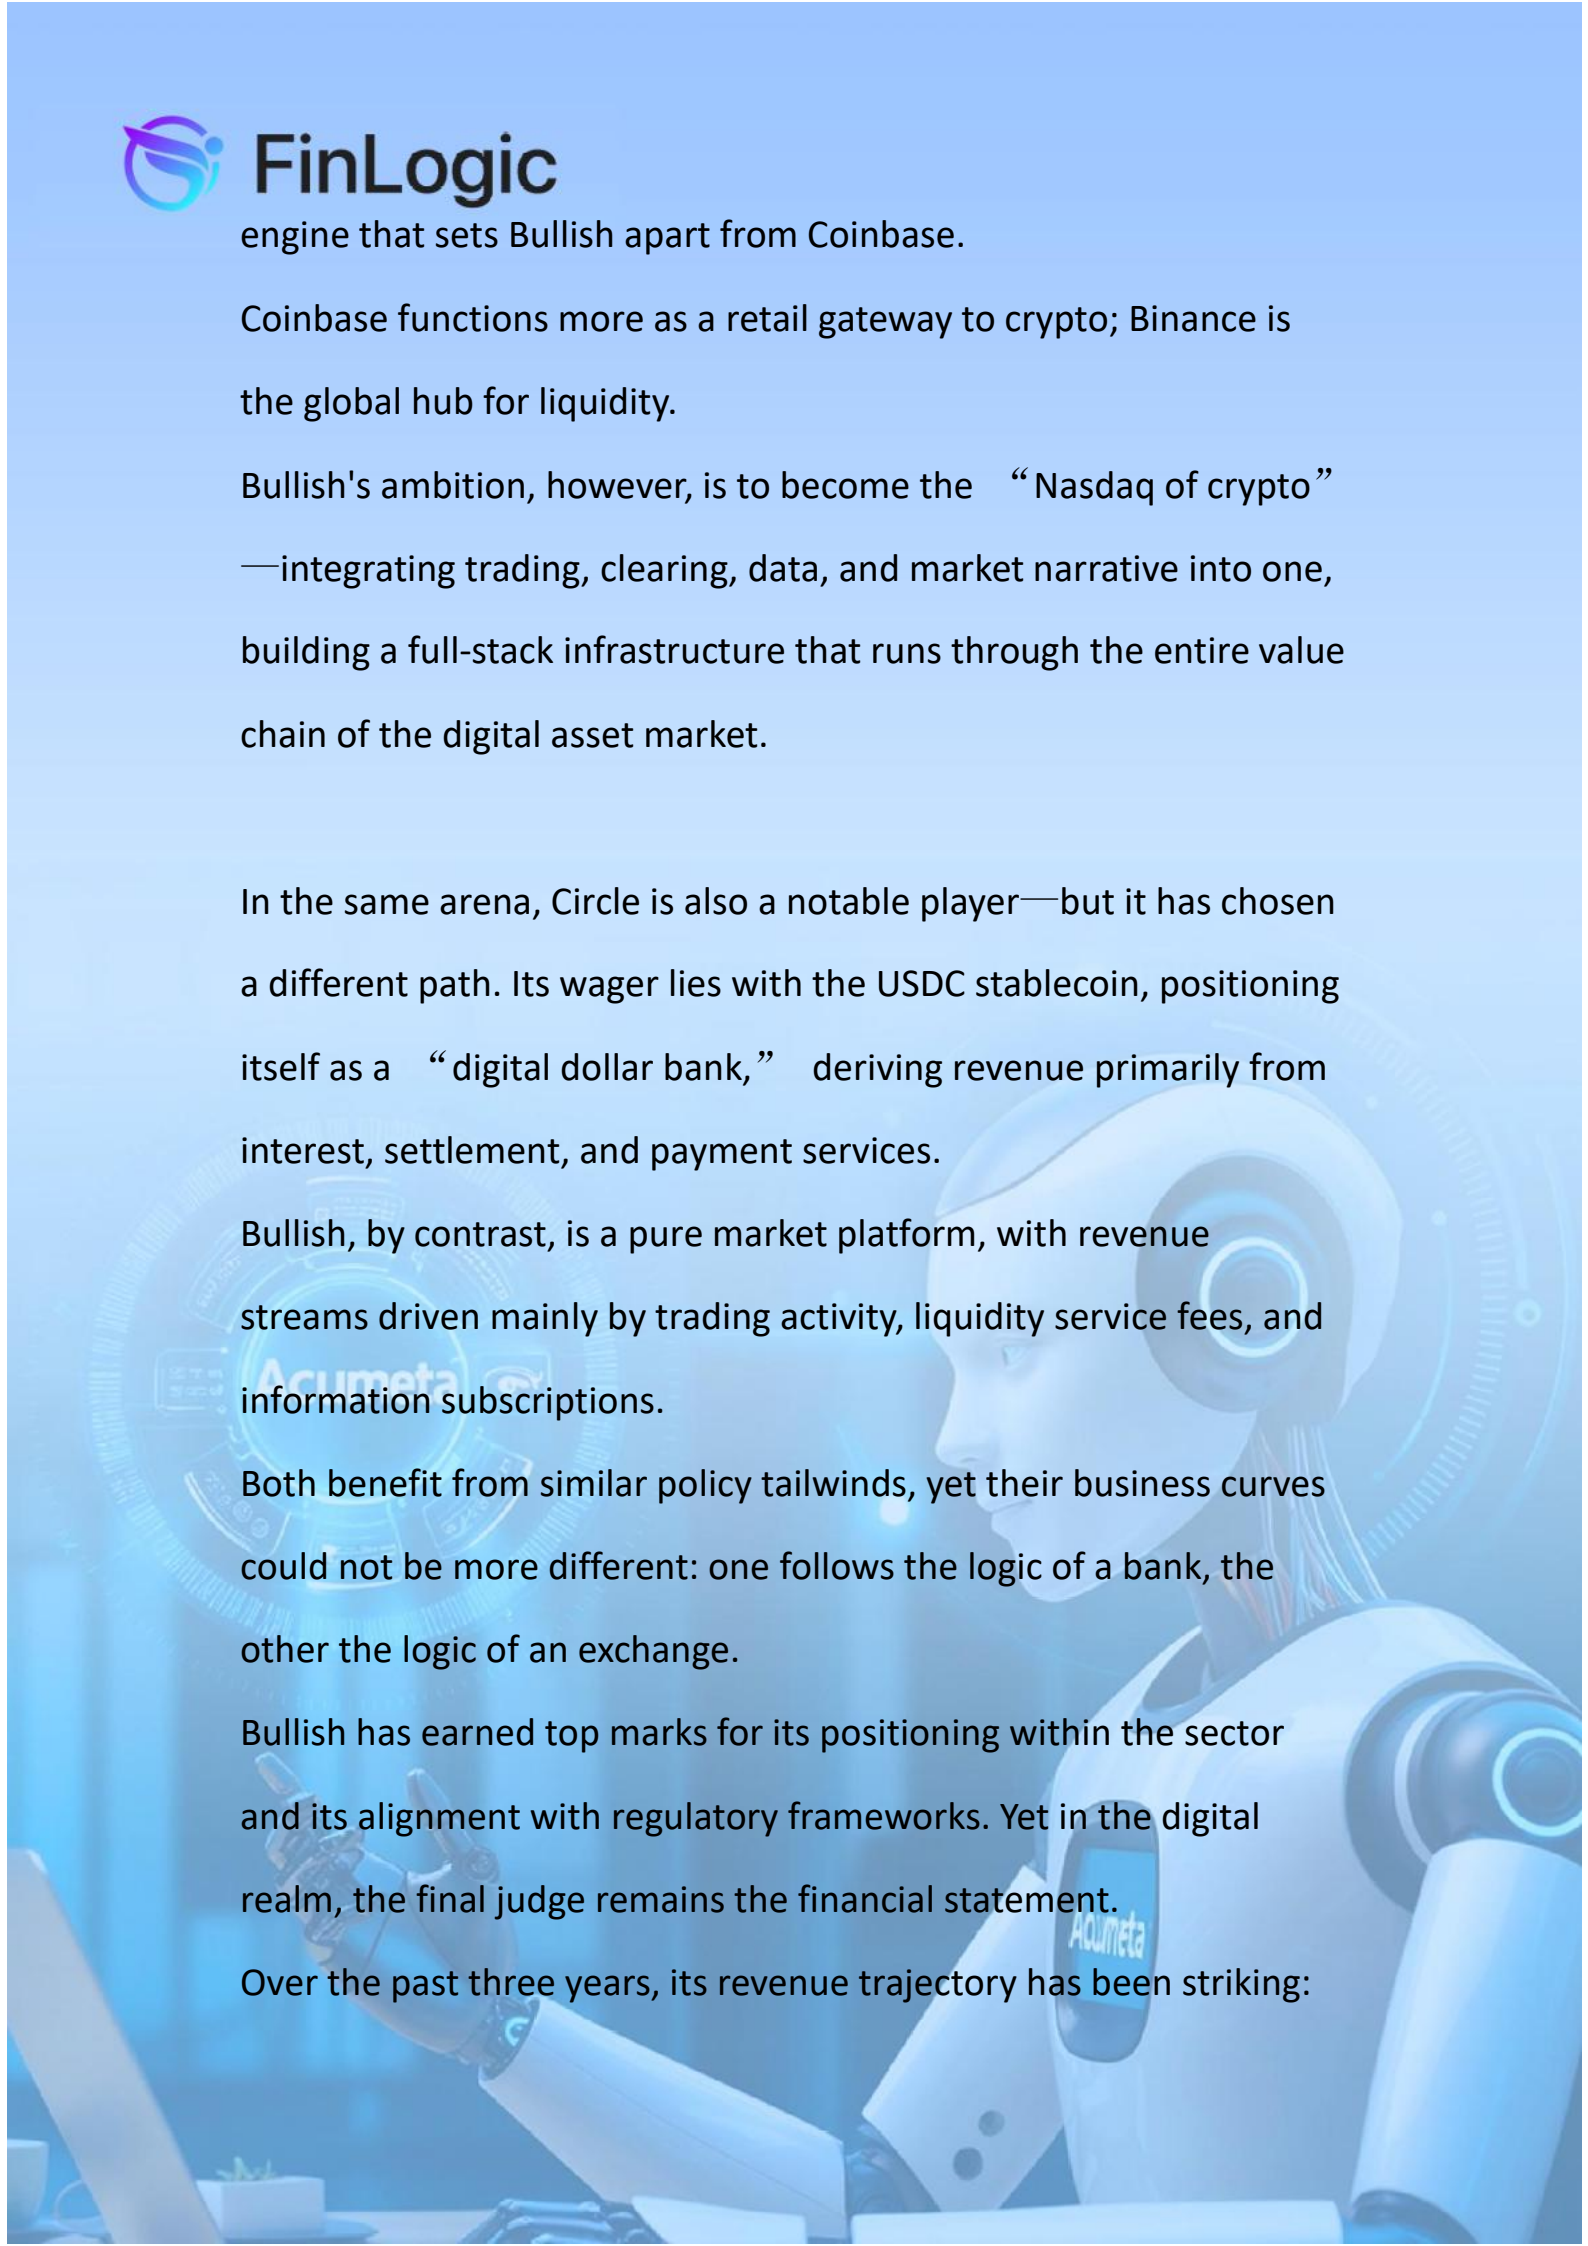

In the same arena, Circle is also a notable player—but it has chosen a different path. Its wager lies with the USDC stablecoin, positioning itself as a “digital dollar bank,” deriving revenue primarily from interest, settlement, and payment services.

Bullish, by contrast, is a pure market platform, with revenue streams driven mainly by trading activity, liquidity service fees, and information subscriptions.

Both benefit from similar policy tailwinds, yet their business curves could not be more different: one follows the logic of a bank, the other the logic of an exchange.

Bullish has earned top marks for its positioning within the sector and its alignment with regulatory frameworks. Yet in the digital realm, the final judge remains the financial statement.

Over the past three years, its revenue trajectory has been striking:

digital asset sales grew from \$72.89 billion in 2022 to \$116.49 billion in 2023, and surpassed \$250 billion in 2024—nearly tripling in just three years.

As we step into 2025, Bullish's growth remains subject to fluctuations.

The primary headwind in Q1 came from a \$246 million Bitcoin impairment—its holding of over 24,000 Bitcoins acted like a massive boulder amid turbulent waters: when the wind is favorable, it pushes the ship forward; when adverse, it can drag the vessel under.

By Q2, with Bitcoin reclaiming new highs and returning to \$122K, the market regained ample room for optimism and profit expectations. Bullish held \$35.7 million in cash and equivalents in the first half of the year, a reserve sufficient to sustain daily operations.

The opportunity lies not just in being an exchange but in controlling

the underlying trading infrastructure and information gateways.

When the bull market returns, it can rapidly amplify trading depth and the scale of derivatives.

More importantly, its compliance footprint spans multiple jurisdictions, enabling swift entry into new markets as they open up.

Winning user trust is the key to unlocking greater profitability.

What do you think BLSH's opening price will be on its first day of trading? Acumeta's forecast stands at \$90.

When you take in the full picture—the blazing hype around this new IPO, BLSH, backed by heavyweight Wall Street capital, led by the former NYSE CEO, and riding the crypto-friendly tailwinds from Trump's “Crypto Capital” initiative—and consider the vast upside potential the market is pricing in, where do you think its highest price might land on day one?

Honestly, I can't say for sure. Maybe the moon is its final destination.

What I do know with certainty is this: if you secure your allotment during the subscription phase, your cost basis will stay locked in between \$28 and \$31. That's a genuine cost advantage—like a sturdy moat shielding you from market volatility.

Folks, BLSH is set to go public this Wednesday. Tuesday is your last

shot to subscribe. Nobody expected time to fly so fast, and the window is closing—just like an NBA Game 7, with the final 30 seconds deciding the outcome. Will you leave yourself with regrets?

IPO subscription opportunities represent just a set of optimized strategies I'm employing within the current unique context of U.S. equity markets.

Clearly, high-quality IPOs don't come around often—but when they do, missing out means missing out for life.

Fortunately, both you and I find ourselves at a pivotal moment, able to foresee these premium offerings.

And make no mistake: the same principle applies to new token launches in the crypto world.

Think of it as a parallel: FIG / BLSH provides tangible lessons on how to approach these opportunities wisely.

New stock = New token.

IPO = STO.

Prospectus = Whitepaper.

The outlook and value of a new stock company align perfectly with those of a new crypto project.

Valuation methods are fundamentally the same.

And the subscription mechanics? Identical.

The only difference is one takes place in a crypto trading hub, the other on a securities exchange.

If such opportunities arise again, would you want me to share them with you?

Monday's dip in U.S. equities is clearly a phase—evidenced by the decline in the VIX, which unmistakably signals a shift in market sentiment.

Having anticipated this outcome, I naturally adjusted my portfolio strategy accordingly.

Are you following suit with your portfolio optimizations today?

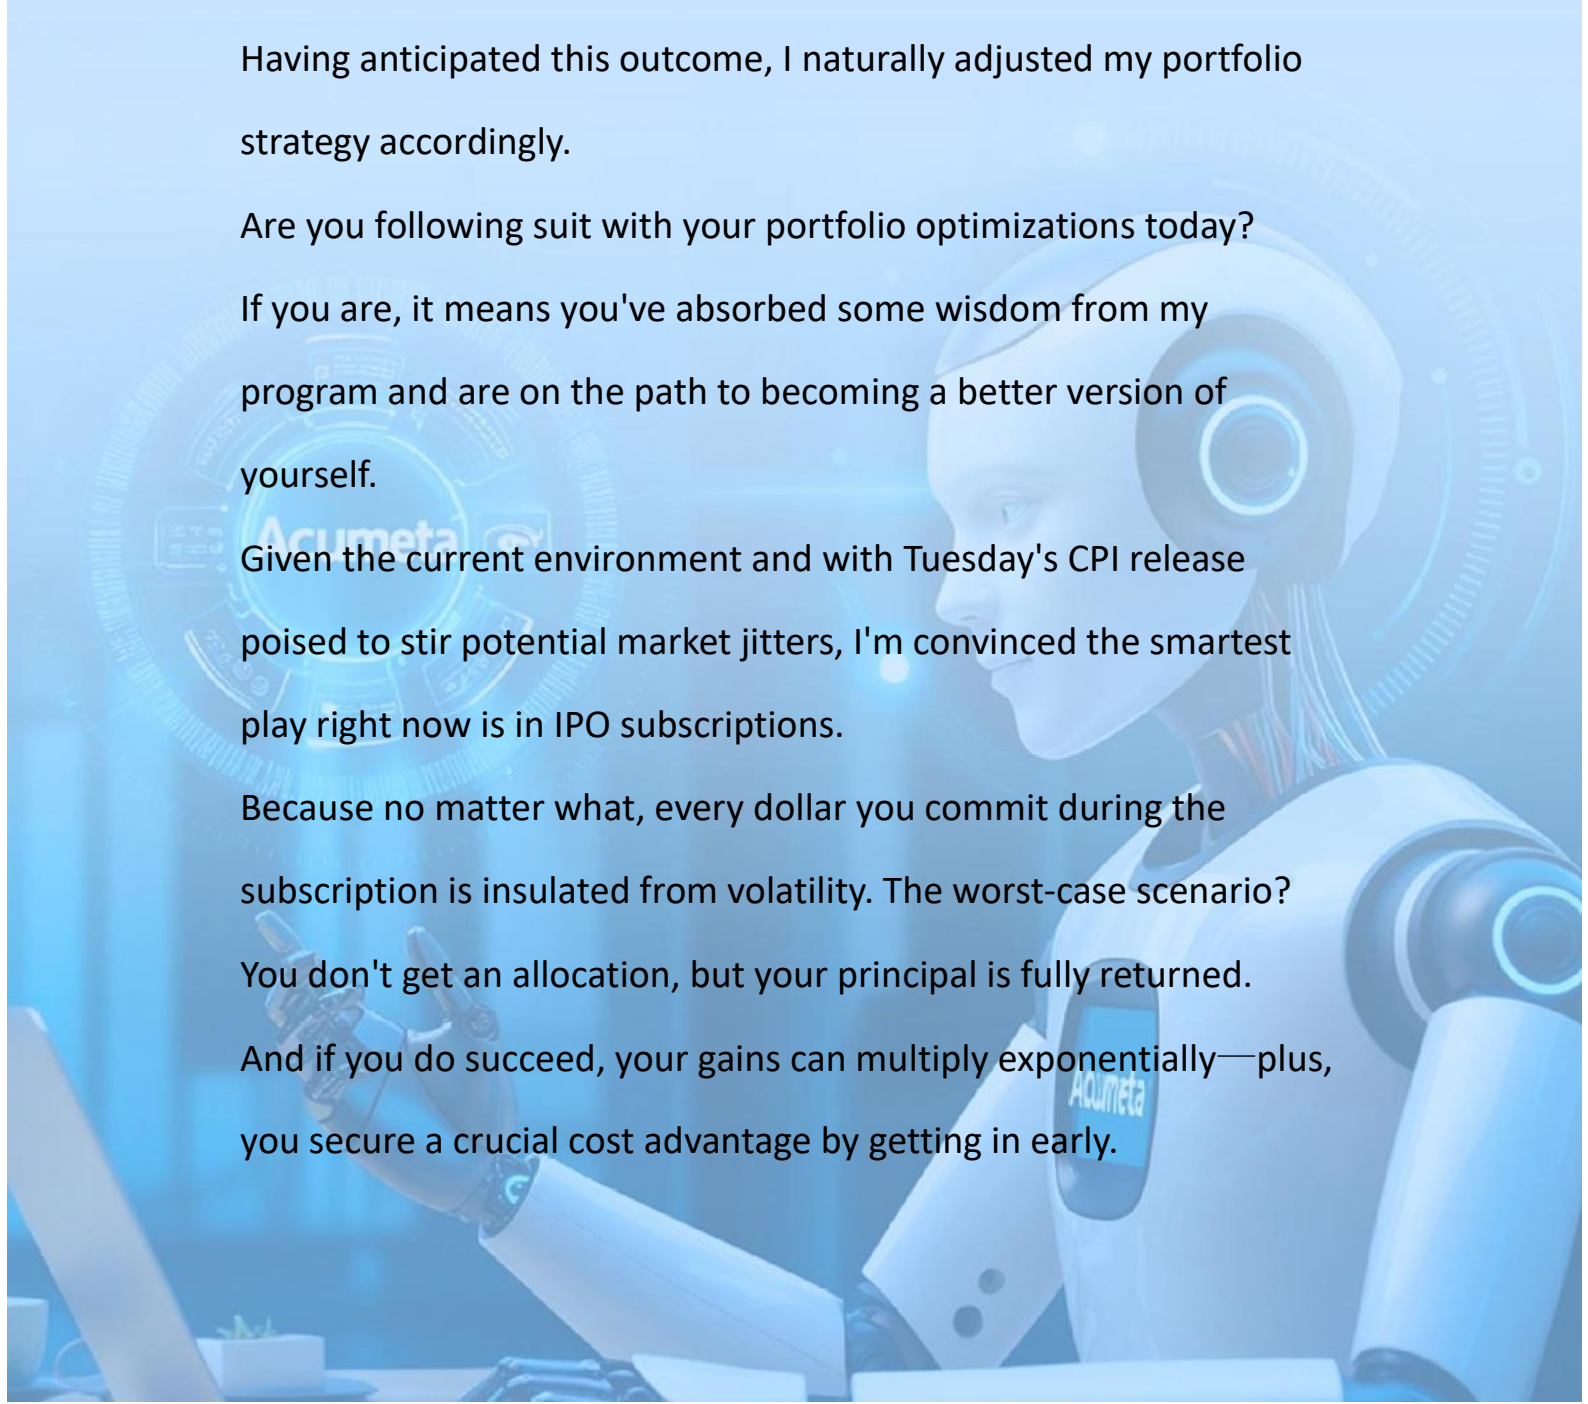

If you are, it means you've absorbed some wisdom from my program and are on the path to becoming a better version of yourself.

Given the current environment and with Tuesday's CPI release poised to stir potential market jitters, I'm convinced the smartest play right now is in IPO subscriptions.

Because no matter what, every dollar you commit during the subscription is insulated from volatility. The worst-case scenario?

You don't get an allocation, but your principal is fully returned.

And if you do succeed, your gains can multiply exponentially—plus, you secure a crucial cost advantage by getting in early.

Cost advantage is the best guardian angel I can offer you during stock market downturns.

Looking at historical IPO first-day performances, it's clear: those who secure favorable subscription prices hold the decisive edge when it comes to timing their sales.

Having the first-mover advantage means that while others scramble to buy shares amid the initial surge, you can strategically distribute your holdings at peak prices—locking in substantial profits.

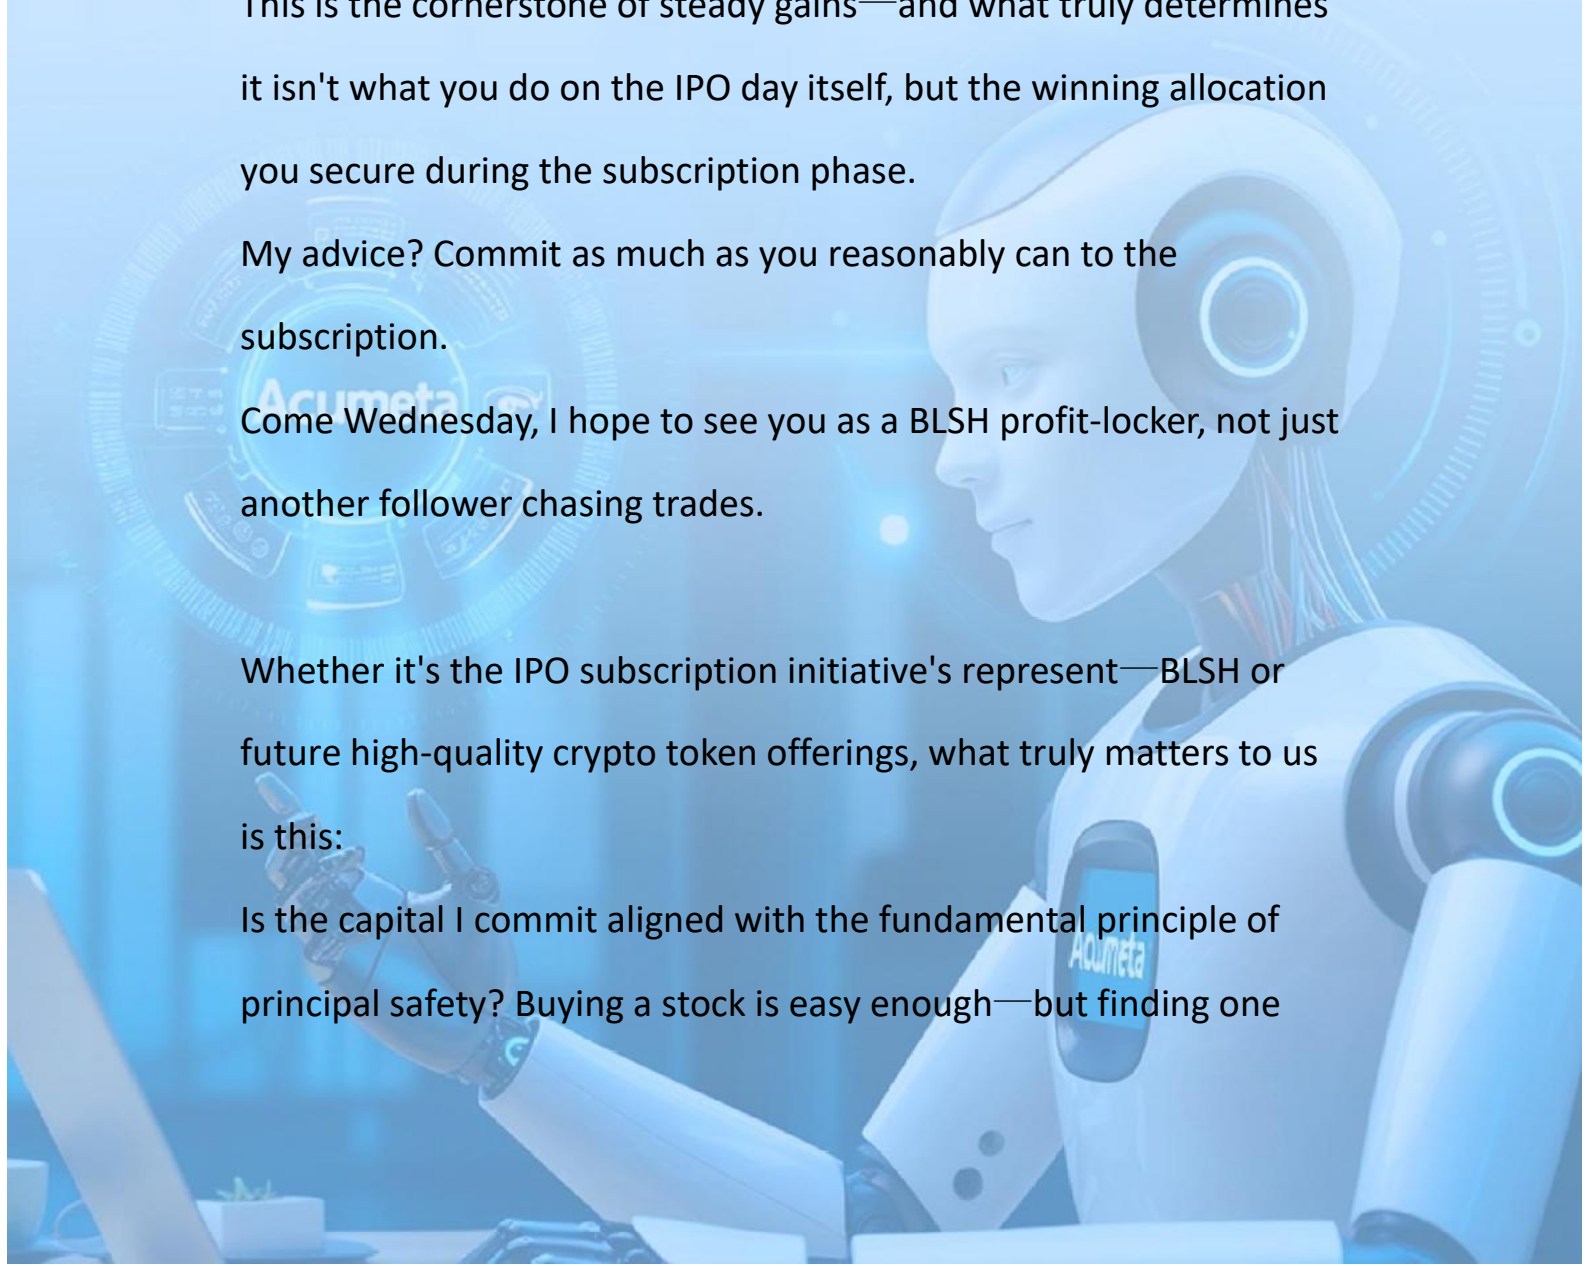

This is the cornerstone of steady gains—and what truly determines it isn't what you do on the IPO day itself, but the winning allocation you secure during the subscription phase.

My advice? Commit as much as you reasonably can to the subscription.

Come Wednesday, I hope to see you as a BLSH profit-locker, not just another follower chasing trades.

Whether it's the IPO subscription initiative's represent—BLSH or future high-quality crypto token offerings, what truly matters to us is this:

Is the capital I commit aligned with the fundamental principle of principal safety? Buying a stock is easy enough—but finding one

that doesn't lose value? That's the real challenge.

And subscriptions offer just that—zero risk. That's their undeniable appeal.

Another core consideration is the expectation that, by the end of a given period, the newly listed stock delivers a moment to lock in substantial profits. This is the ultimate market test for any quality company or project.

Finally, knowing the zero-risk nature of subscriptions empowers us to confidently increase our allocation, aiming for a higher winning ratio—this feeling is truly exhilarating.

The balance of offense and defense is what defines NBA superstars. Life is no different—nor is investing.

Charlie Munger once said:

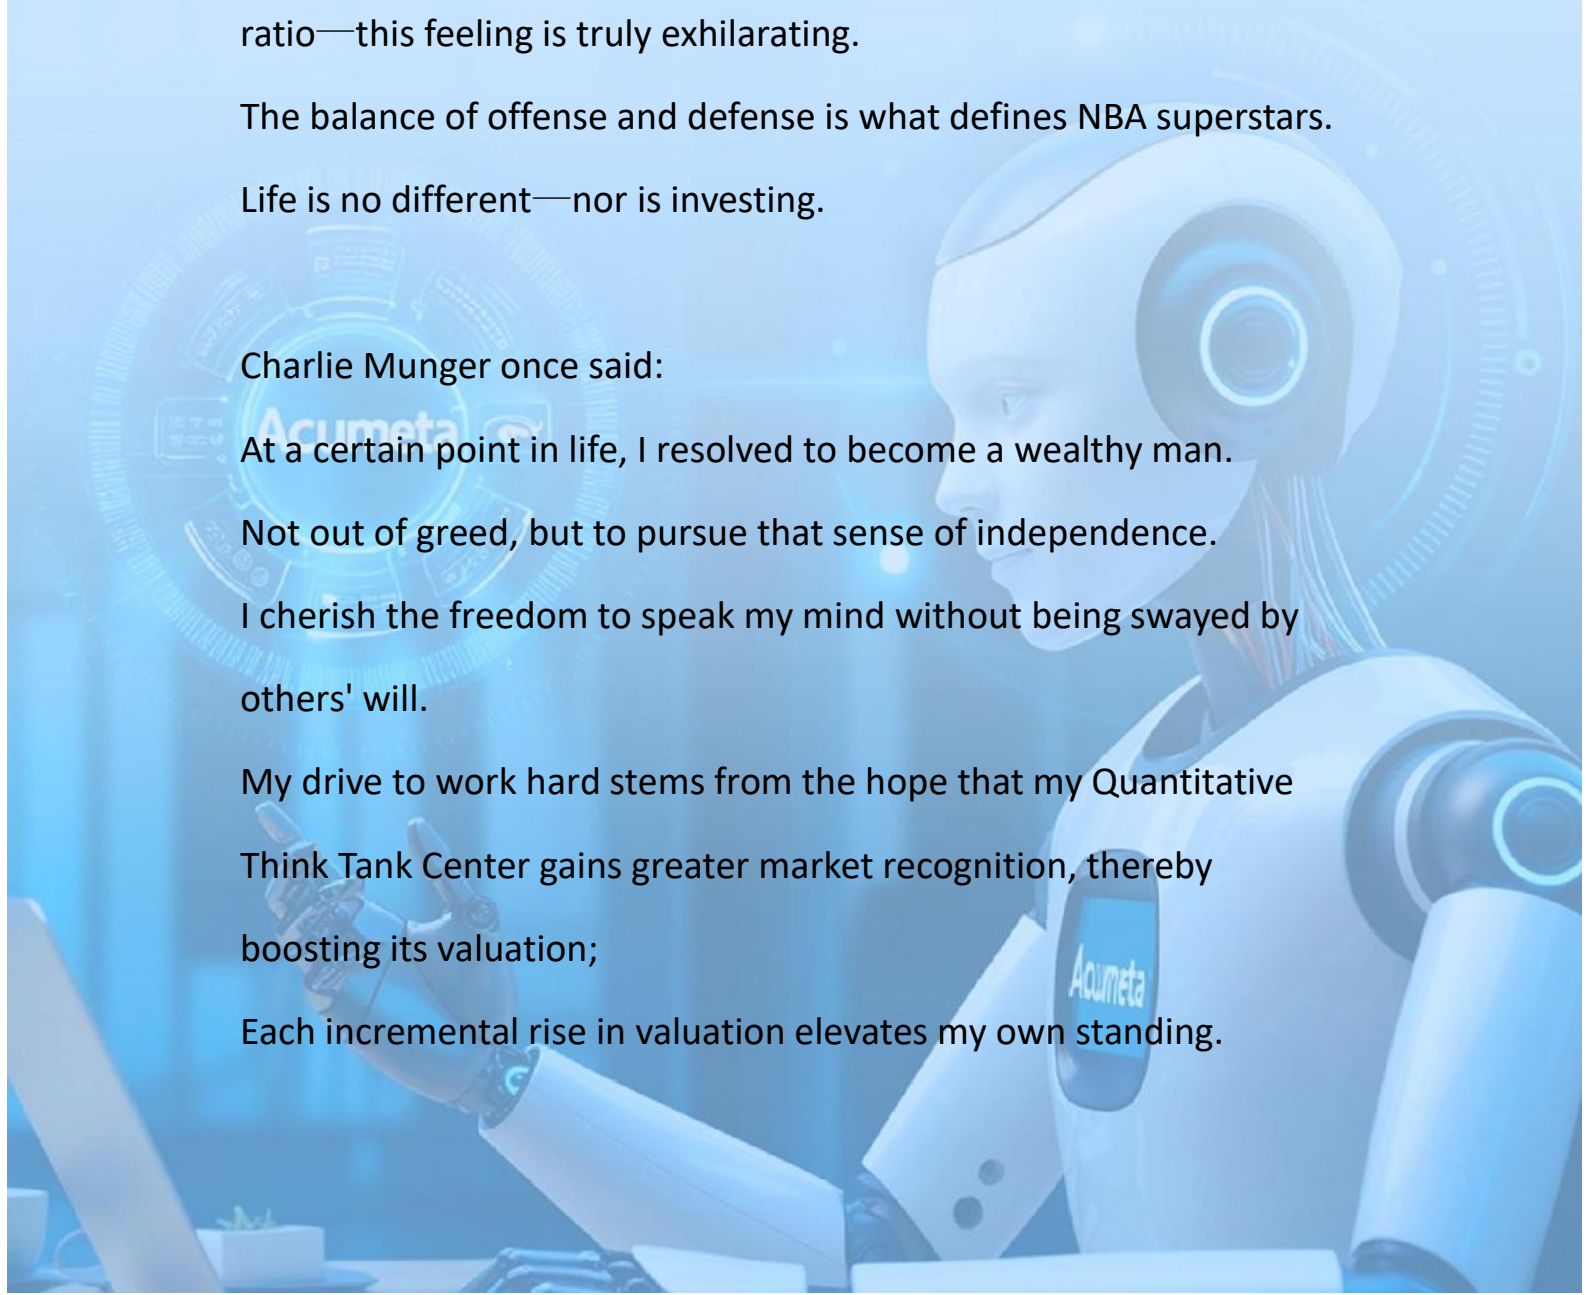

At a certain point in life, I resolved to become a wealthy man.

Not out of greed, but to pursue that sense of independence.

I cherish the freedom to speak my mind without being swayed by others' will.

My drive to work hard stems from the hope that my Quantitative Think Tank Center gains greater market recognition, thereby boosting its valuation;

Each incremental rise in valuation elevates my own standing.

But the same applies to you—you seek quality, safe investment opportunities, and in doing so, you too will become wealthy.

Right now, the quantitative strategy portfolio you follow is on track to meet your expectations and make you a wealth winner. Have you taken action, guys?

On Tuesday, I look forward to seeing your BLSH subscription size as you wish, ready to welcome your good fortune.

Review the program content, and join the Token Redemption Carnival by claiming your reservation card!

1. Do you think U.S. stock valuations are currently too high? Are you concerned about the risks?
2. If the Fed cuts rates in September, how will you adjust your asset allocation?
3. What wisdom have you gained from the BLSH IPO subscription?

Do you know how to increase your allotment ratio?

Reply with your answers, and may God bless you all the best! See you.
