

Thursday, Aug 14, 2025

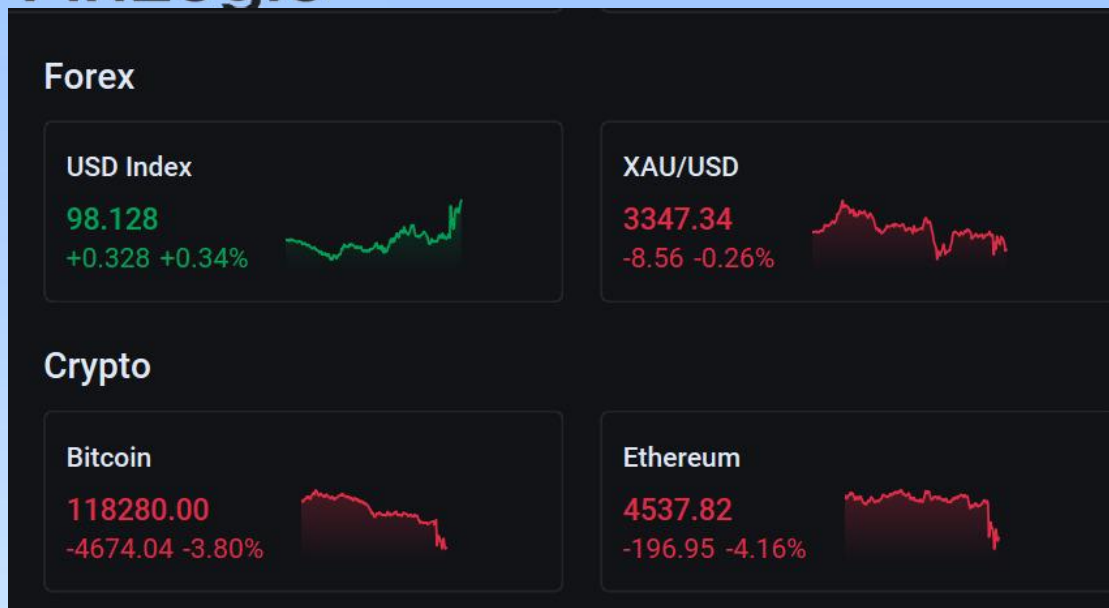

Good morning to the Acumeta certification beneficiaries—the major winners in on-chain wealth.

Before the market opened today, we all witnessed a dramatic shift. Thursday's PPI data came in well above expectations, like a sudden dark cloud drifting in on what should have been a bright, sunny day. That cloud was the persistent worry over inflation.

It instantly fractured what had been firm expectations for rate cuts, leaving the market's direction uncertain and difficult to read.

Under this cloud of uncertainty, we saw cryptocurrencies sell off and stock index futures swing in pre-market trading—each sending its own signal of fear and unease.

This inevitably leads us to a deeper question: what exactly does this kind of temporary downturn mean?

When Thursday's PPI came in noticeably above Wall Street's expectations, the market reacted instantly—like a pot brought to a sudden boil. The ghost of inflation shows up from the alleyway. The September rate cut, once considered all but certain, suddenly resembled a baseball cap caught in the wind—its course erratic and unpredictable. Pre-market equity index futures dropped sharply, and cryptocurrencies followed suit—BTC and ETH both falling across the board, as if someone had pulled the market's emergency brake.

The market is not a straight path; it is a track riddled with bumps and sharp turns.

Each downturn is like a water station in a marathon—an obstacle for the unprepared, yet a burst of fuel for those who are ready.

My quantitative strategy portfolio had already been recalibrated before the PPI data was released—not because I possess a crystal

ball, but because history has long shown: a temporary decline is not a flood or a monster; it is an entry point.

Why did the higher-than-expected pre-market PPI reading trigger such concentrated market turbulence?

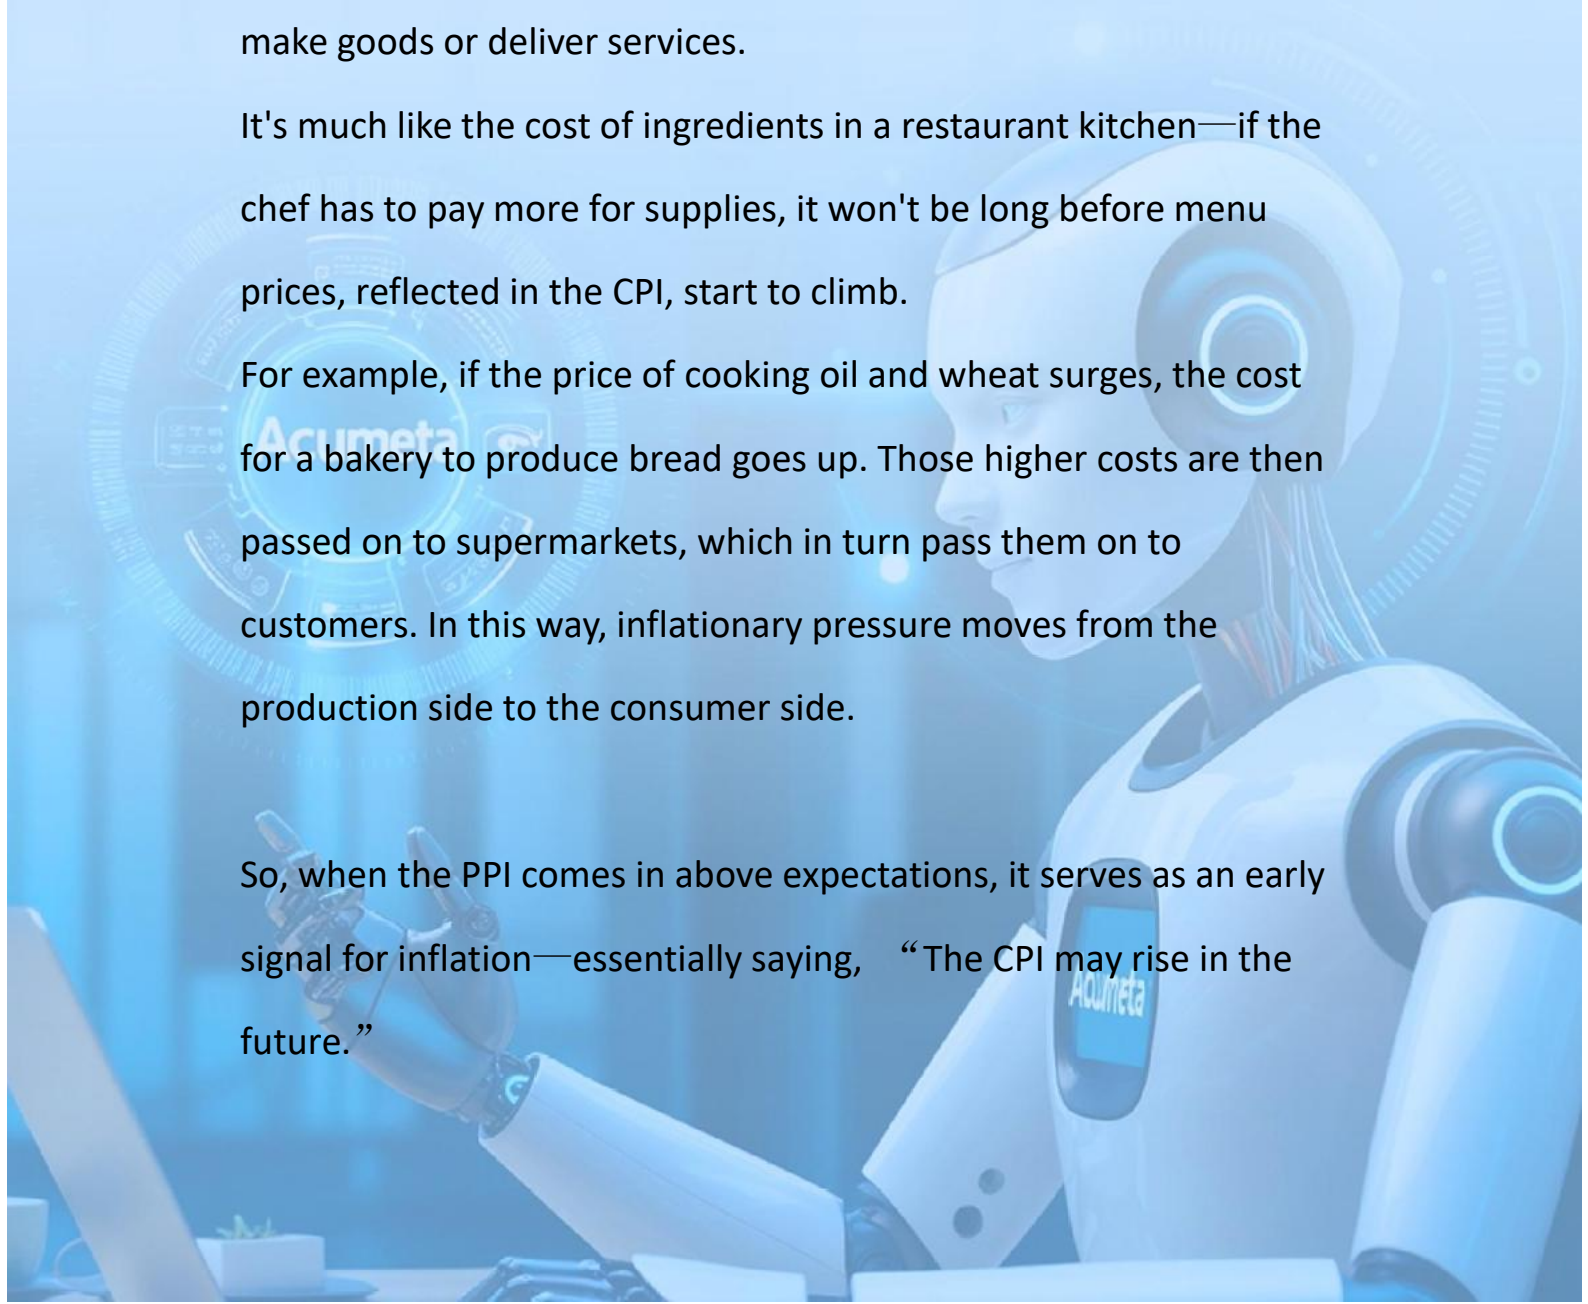

We need to be clear on what the PPI represents. You can think of it as a “factory-gate” index—measuring the change in prices for goods and services at the point of production or wholesale.

When the PPI rises, it means producers are facing higher costs to make goods or deliver services.

It's much like the cost of ingredients in a restaurant kitchen—if the chef has to pay more for supplies, it won't be long before menu prices, reflected in the CPI, start to climb.

For example, if the price of cooking oil and wheat surges, the cost for a bakery to produce bread goes up. Those higher costs are then passed on to supermarkets, which in turn pass them on to customers. In this way, inflationary pressure moves from the production side to the consumer side.

So, when the PPI comes in above expectations, it serves as an early signal for inflation—essentially saying, “The CPI may rise in the future.”

FinLogic

Why does this affect expectations for rate cuts?

That brings us back to the Fed's core mandate: to keep inflation in check and to promote employment.

When inflation is running high, the Fed's primary task is to contain it —often through measures such as raising interest rates.

Conversely, when inflation is under control, the Fed can consider cutting rates to stimulate economic growth.

At present, a higher-than-expected PPI raises concerns about future inflation, prompting Fed officials to tread carefully.

Their thinking might be: “If we cut rates now, more money will flow into the market—wouldn't that risk making inflation worse?”

A higher-than-expected PPI is essentially a yellow light for the Fed's rate-cut plans.

It signals the possibility of inflation ahead, prompting the Fed to delay a rate cut or reduce its size to mitigate that risk.

Put simply—imagine you own a hamburger chain.

PPI above expectations: Your upstream suppliers—beef, buns, lettuce—have all gone up in price. That's the PPI surprise.

Inflation anxiety: You think, “My costs are climbing. I have to raise the price of my burgers, or I'll be selling at a loss.” That's your version of inflation anxiety.

Impact on rate-cut expectations: Consumers in the market—and the Fed—see that you, along with every other burger shop, are raising prices.

The Fed worries that if they cut rates now, putting more money in circulation, you and other businesses might hike prices even further.

To avoid that, they might choose to postpone a rate cut—or leave rates unchanged altogether.

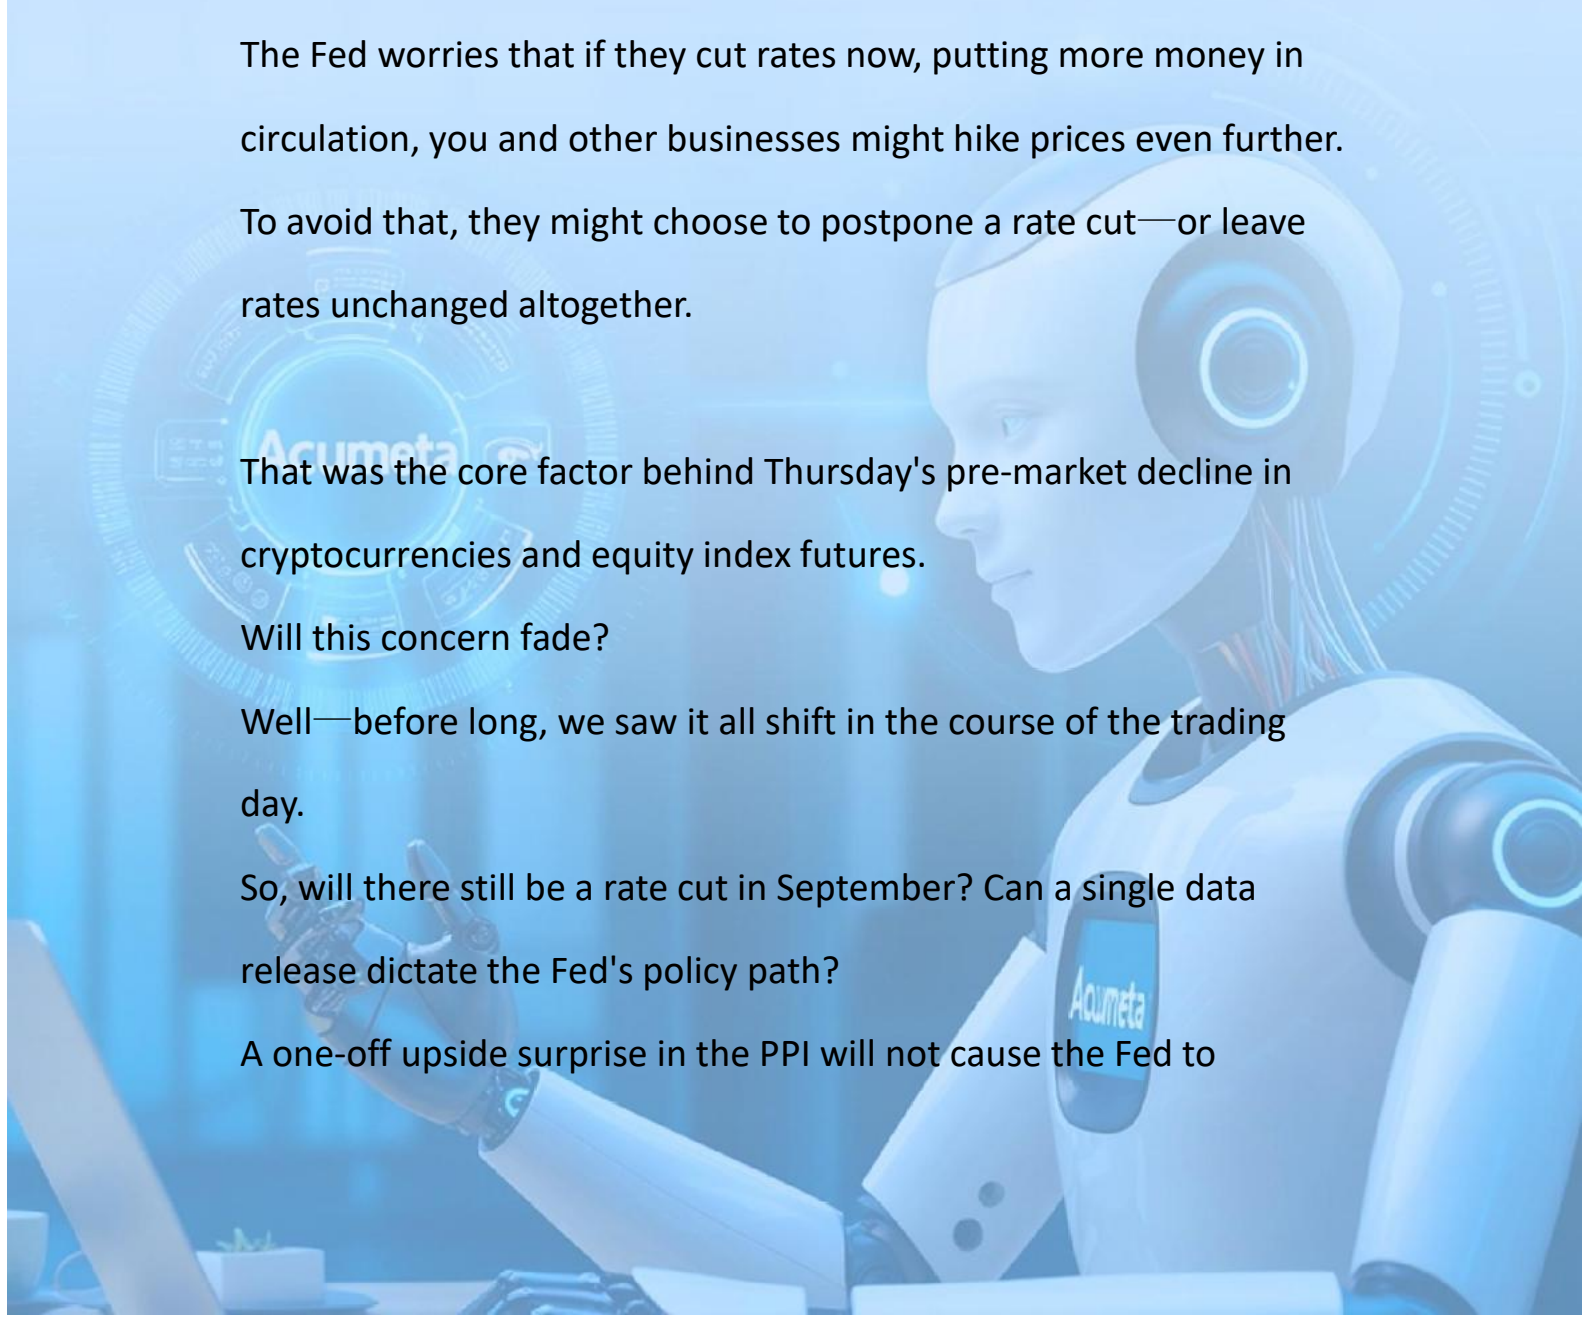

That was the core factor behind Thursday's pre-market decline in cryptocurrencies and equity index futures.

Will this concern fade?

Well—before long, we saw it all shift in the course of the trading day.

So, will there still be a rate cut in September? Can a single data release dictate the Fed's policy path?

A one-off upside surprise in the PPI will not cause the Fed to

abruptly abandon its rate-cut plans, for a simple reason: the Fed watches the trend, not an isolated data point.

Why a single number doesn't alter the course

Imagine you're driving to Los Angeles and you hit a red light. You don't turn around and head home—the light is just a brief pause, the destination unchanged.

It's the same with the PPI. It's one component of the economic picture. The Fed's focus is on the broader trajectory of prices and the overall signals from the economy, not the noise of a single month's fluctuation.

A single spike in the PPI will be noted by the Fed, but it will not prompt an immediate change in the direction of rate cuts. They will wait for more data to confirm the trend. A single month's reading is “noise”; the trend is the “melody.”

The trend is the “melody.”

It reflects a sustained and steady direction in the data over a longer period of time.

For example, when the Fed considers cutting rates, it does not look solely at one month's PPI reading. It examines inflation data over several months, even years, to see whether those figures are consistently and steadily moving toward its target—say, 2%. That

series of consistent data points forms the “melody” on which the Fed bases its decisions.

In everyday life: if, for several consecutive months, you maintain regular exercise and healthy eating habits, and your weight keeps declining, that is your “melody.”

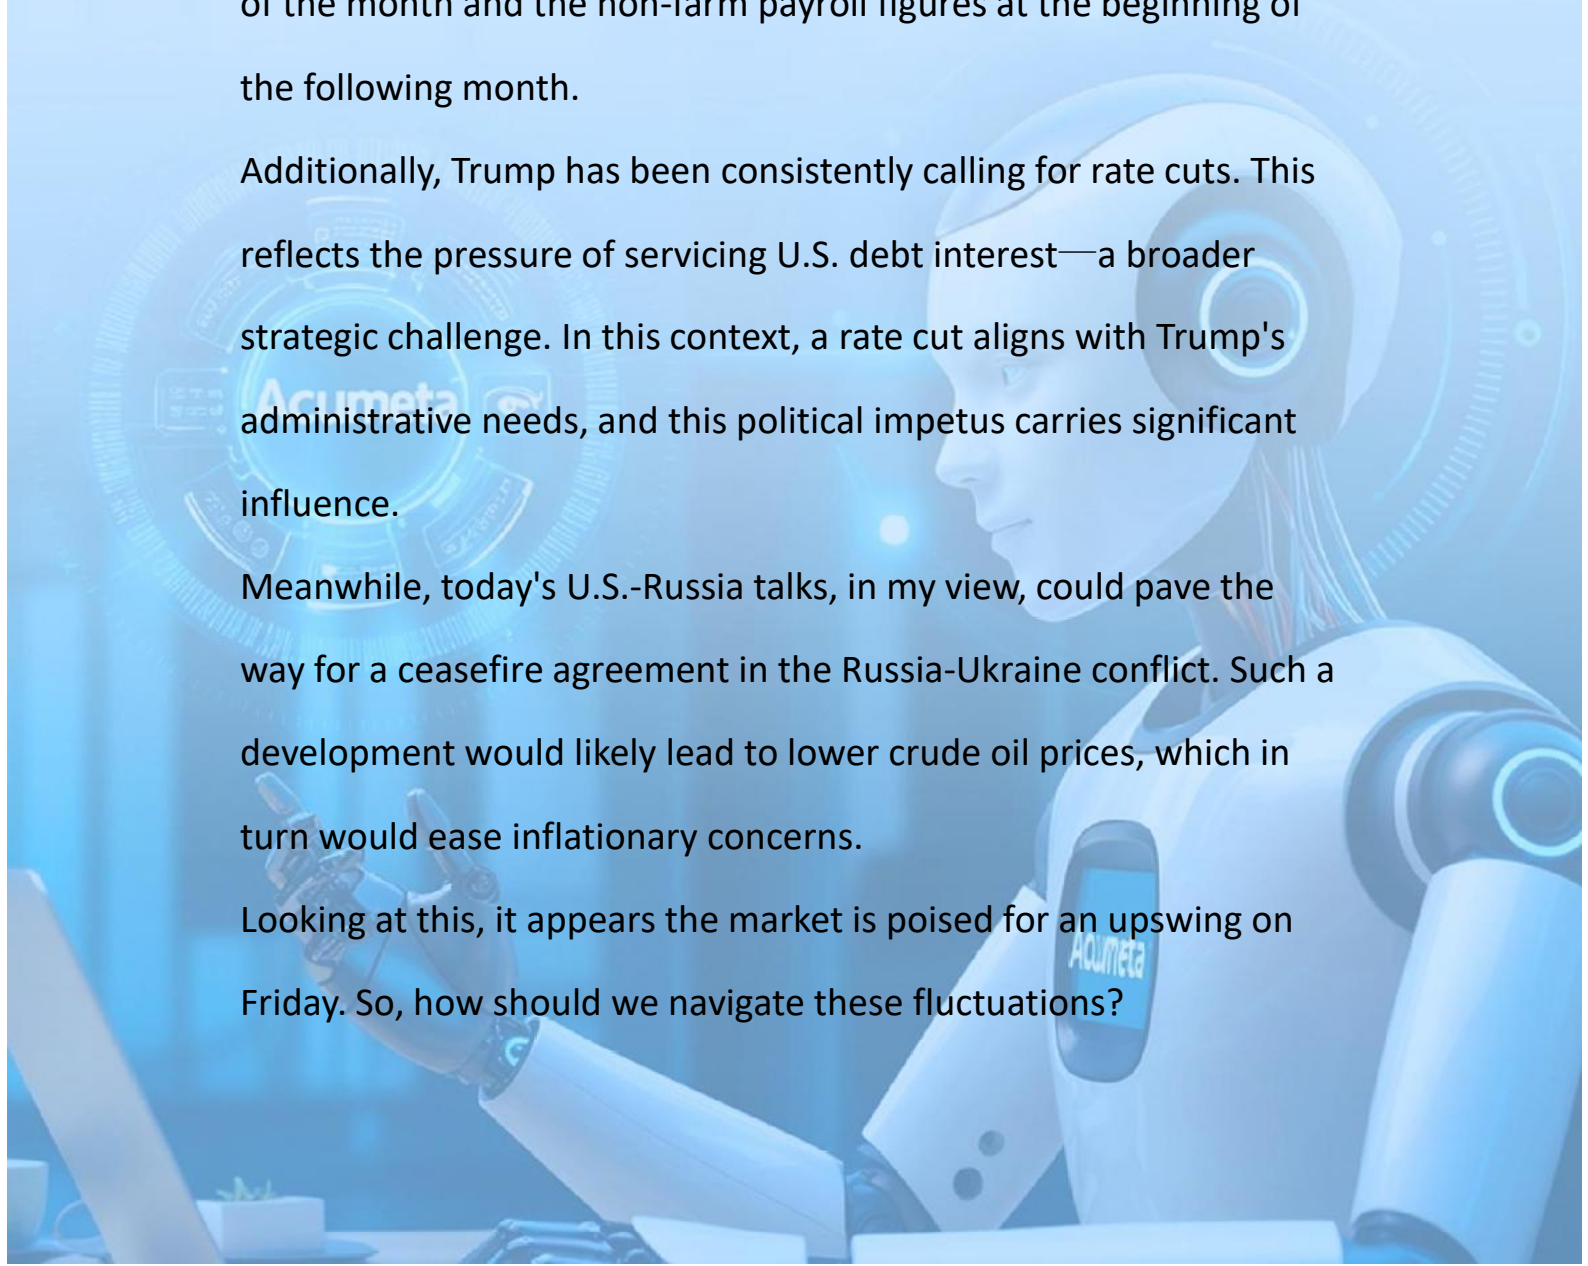

It reflects a fundamental change in your way of living.

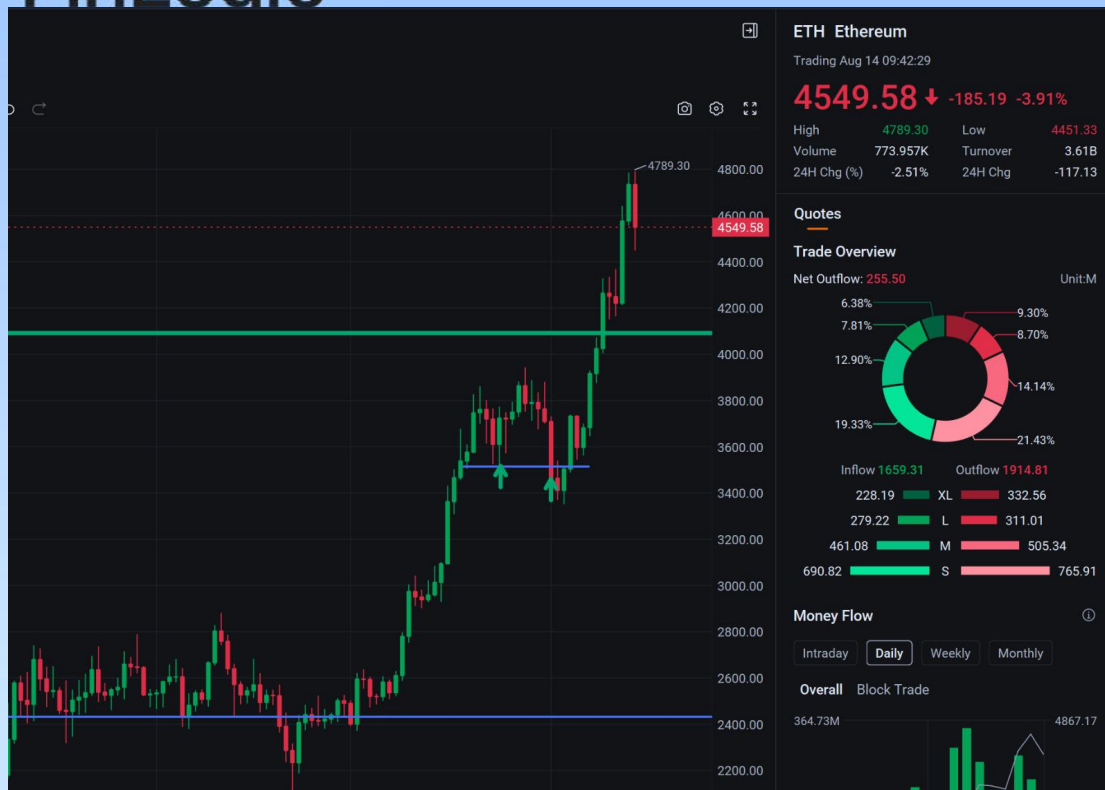

Therefore, the potential reference points for a September rate cut by the Federal Reserve also include the PEC inflation data at the end of the month and the non-farm payroll figures at the beginning of the following month.

Additionally, Trump has been consistently calling for rate cuts. This reflects the pressure of servicing U.S. debt interest—a broader strategic challenge. In this context, a rate cut aligns with Trump's administrative needs, and this political impetus carries significant influence.

Meanwhile, today's U.S.-Russia talks, in my view, could pave the way for a ceasefire agreement in the Russia-Ukraine conflict. Such a development would likely lead to lower crude oil prices, which in turn would ease inflationary concerns.

Looking at this, it appears the market is poised for an upswing on Friday. So, how should we navigate these fluctuations?

Has the market downturn and volatility presented us with a challenge?

According to my optimized quantitative strategy portfolio, this is exactly an opportunity.

Here's how the quantitative strategy portfolio is executed:

Thirty percent of capital is allocated to the Win the Race for Reserve Digital Token Challenge. During short-term declines, this presents a better entry point and a cost advantage.

Remember the last time ETH fell below \$3,500—I urged you to take a similar action.

This latest dip, down to \$4,500 and below, is once again a demonstration of favorable cost entry.

You should understand that the advantageous positions sold by

speculators are absorbed by mainstream institutions, and your willingness to act now is key to securing these cost advantages. This, of course, includes the opportunities created by BTC's decline. We have never relied on one-hour or one-day trading gains to define wealth, and I trust you think the same, don't you?

Another key strategy in my quantitative portfolio is allocating 50% of total capital to subscribing for new stocks or tokens.

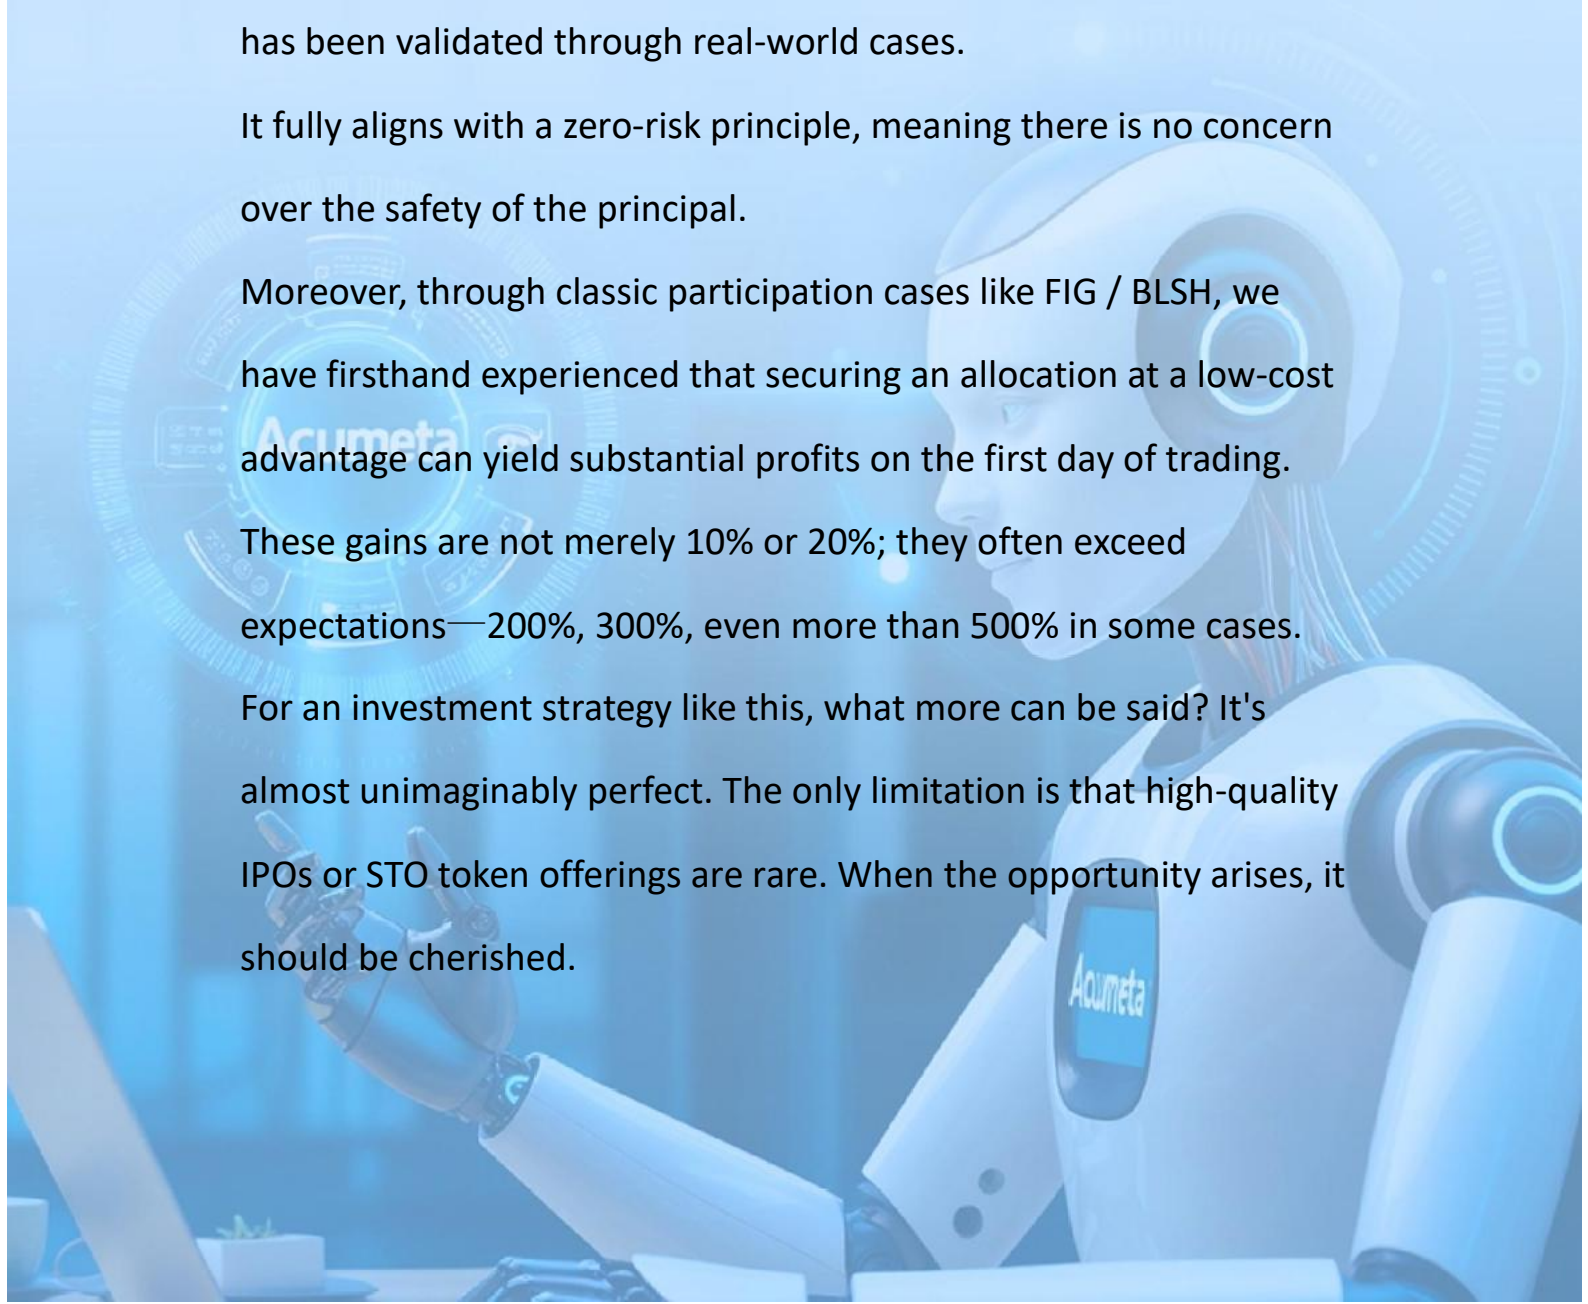

This approach—investing in pre-IPO shares or pre-token offerings—has been validated through real-world cases.

It fully aligns with a zero-risk principle, meaning there is no concern over the safety of the principal.

Moreover, through classic participation cases like FIG / BLSH, we have firsthand experienced that securing an allocation at a low-cost advantage can yield substantial profits on the first day of trading.

These gains are not merely 10% or 20%; they often exceed expectations—200%, 300%, even more than 500% in some cases.

For an investment strategy like this, what more can be said? It's almost unimaginably perfect. The only limitation is that high-quality IPOs or STO token offerings are rare. When the opportunity arises, it should be cherished.

This unprecedented golden era of cryptocurrency has arrived before us.

&&& From the federal level, legislation passed by Congress has provided a regulatory foundation.

Supportive stances from key officials at agencies like the SEC have injected fresh vitality into the market.

This is a point of pride for Americans—and, indeed, a source of genuine satisfaction.

&&& Through the U.S. government's pro-crypto initiatives, executive orders have laid the groundwork for a “Crypto Capital,” promoting crypto reserve programs, introducing BTC reserve strategies, allocating pension funds, and even having the President personally prohibit banks from discriminating against crypto transaction services.

&&& We understand that the growth and prosperity of the crypto

sector is not about benefiting any single individual—it is about reinforcing U.S. credibility. Indeed, it serves the interests of major holders of U.S. Treasury debt.

The foundation of the crypto world, stablecoin USDC, is backed by U.S. Treasuries for every issuance. In the future, crypto participants not just across America, but around the globe, will hold U.S. debt—this is the real solution to the U.S. debt challenge.

Ultimately, this grand strategic initiative by the U.S. converges on a single point: the Fed's rate cut. A September rate cut should come as expected—yes, that is precisely the certainty we anticipate.

On the eve of September's rate-cut decision, what am I encouraging you to do?

1. Clarify potential risks in the stock market ahead: Anticipate the pullback and downside risk from late August through September.

Looking at it now, the reliability of this projection is even more certain.

2. Optimize your quantitative investment portfolio: Blend safe investments with growth assets to create opportunities for long-term value and collaboration.

3. Launch the Quantitative Think Tank Center token: FGT Redemption Carnival.

FinLogic

This event will truly demonstrate how we enhance valuation and, through token price fluctuations, reflect the market's recognition.

Do you have enough token vouchers in hand today? Have you completed your reservation? I look forward to you claiming your tokens next week.

So, what is the current market value of the token vouchers in your hands?

As the chart shows, the token is currently trading at 0.7 USDC.

Yes, compared to yesterday, we're seeing a modest uptick.

What does this growth signify?

It indicates that our Redemption Carnival has drawn market attention, with institutional capital entering and bolstering reserves.

According to the token FGT's current whitepaper economics, the total issuance is 500 million tokens. Based on the current valuation, our Quantitative Think Tank Center carries a conservative valuation of \$350 million.

As the results of our ongoing quantitative strategy services continue to roll out, and the community of service users grows comprehensively, the token's price is expected to rise further—translating into an even larger valuation.

You know, when you first joined us, I set the goal to achieve a \$3 billion valuation potential.

That means my token could rise to at least 6 USDC.

So, are you ready to own it—and hold it for the long term?

To host a truly impressive and successful Token Redemption Carnival, I need every community member to complete a meaningful survey—participation comes with rewards! The content is as follows:

FGT Token Redemption Carnival Engagement Survey

To deliver an extraordinary and memorable online Token Redemption Carnival, we are launching this special survey.

Community participants will receive extra token vouchers as a reward:

1. Are you aware that the U.S. has three major crypto-related laws?

Can you name all three?

2. Do you know which stablecoin is currently the only one globally recognized as legally compliant? Do you hold it?

3. Trump signed an executive order forbidding banks from

discriminating against cryptocurrency transactions. Were you aware?

If you encounter such unreasonable obstruction, how would you respond?

4. Have you ever experienced the safety and high returns of investing in a new IPO? Would you look forward to similar activities with new token launches?

5. If pensions were allowed to access cryptocurrency reserves, what allocation percentage would you anticipate? Are you a supporter of this presidential executive order?

Thank you for completing the survey. I will be sending your token vouchers and reservation cards shortly! Enjoy a flawless Redemption Carnival!

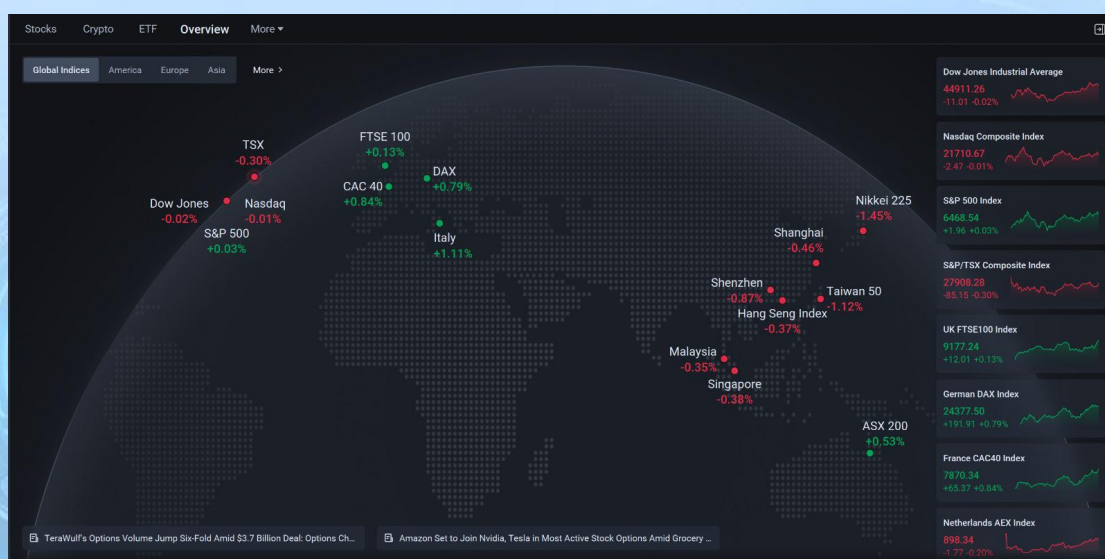

To the future on-chain victors:

Life's ups and downs are much like Wall Street candlestick charts—sometimes blazing red, sometimes chillingly green. But the true masters? They don't sweat a day or two of fluctuation, because they know the sun is always waiting behind the clouds.

Today, when we talk about the Token Redemption Carnival, understand this: it's far from an ordinary event. It's the launchpad for your wealth encryption reserve plan. Once ignited, you have the chance to soar to unprecedented heights of on-chain prosperity.

The secret of on-chain wealth lies in its scarcity—it isn't like a money printer with an infinite supply. It's rare, decentralized, and global. This gives it a strategic stature in the future financial system, even surpassing gold. And this Token Redemption Carnival is precisely the moment to put your future on that launch trajectory. Let's count down to the carnival like NASA counting down a rocket launch—because when that rocket lifts off, you'll realize you're no longer just a market participant; you are the protagonist of the next chapter in the saga of crypto wealth. See you this afternoon!

Folks,

Thursday may have appeared devoid of opportunity, yet it quietly revealed a new direction for investment. We all witnessed that brief tremor in the market—much like an unexpected curve on a familiar road. Many, understandably, chose to brake at the sight of it.

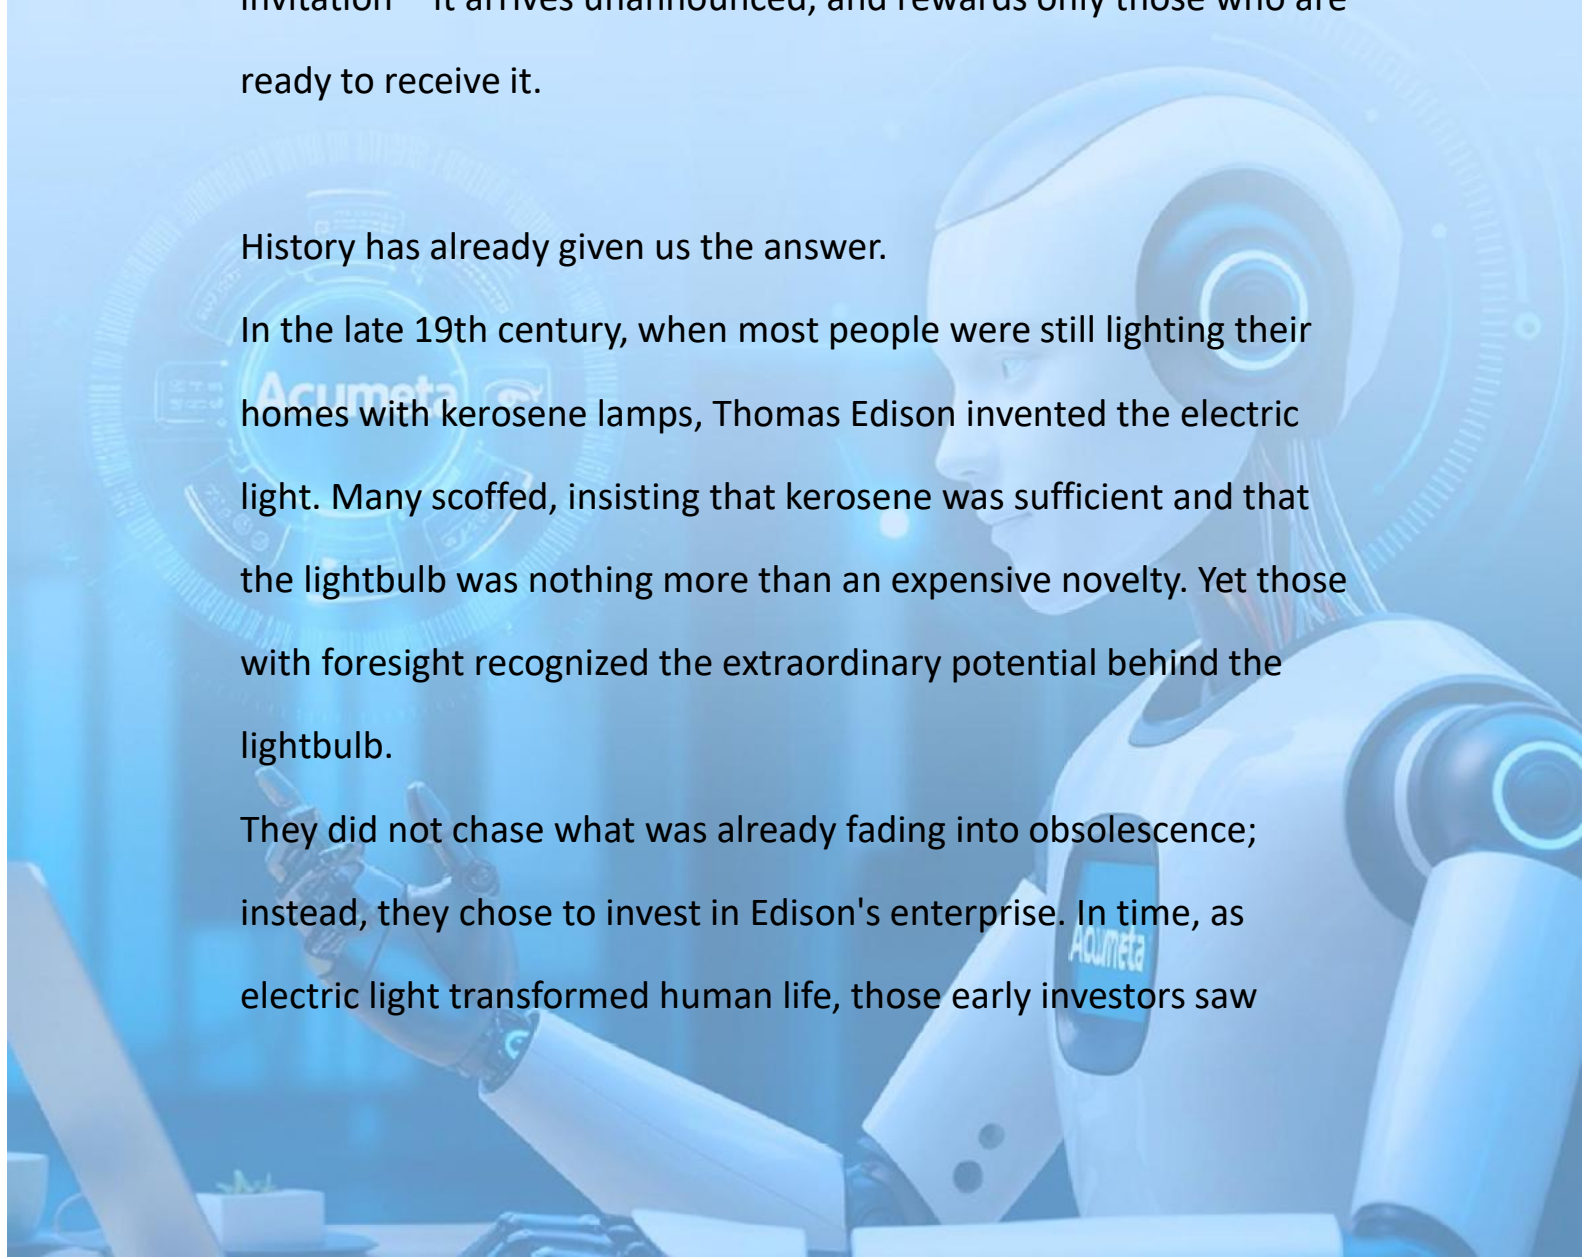

But for those of us who came prepared, that moment of turbulence was, in truth, an exceptional entry point into the world of digital assets. We did not allow the immediate fluctuations to cloud our judgment; rather, we observed them as a seasoned surfer does—recognizing, in the retreat of one wave, the imminent rise of another.

Where some see volatility and retreat, those with experience understand that such moments are when the market quietly hands you a ticket of admission. Opportunity does not linger for an invitation—it arrives unannounced, and rewards only those who are ready to receive it.

History has already given us the answer.

In the late 19th century, when most people were still lighting their homes with kerosene lamps, Thomas Edison invented the electric light. Many scoffed, insisting that kerosene was sufficient and that the lightbulb was nothing more than an expensive novelty. Yet those with foresight recognized the extraordinary potential behind the lightbulb.

They did not chase what was already fading into obsolescence; instead, they chose to invest in Edison's enterprise. In time, as electric light transformed human life, those early investors saw

returns of remarkable scale.

This story reminds us that true wealth often lies hidden within opportunities others fail to notice. Today, our quantitative strategy portfolio stands as a tested proof of that principle. We are not speaking in abstractions—we let the results speak for themselves.

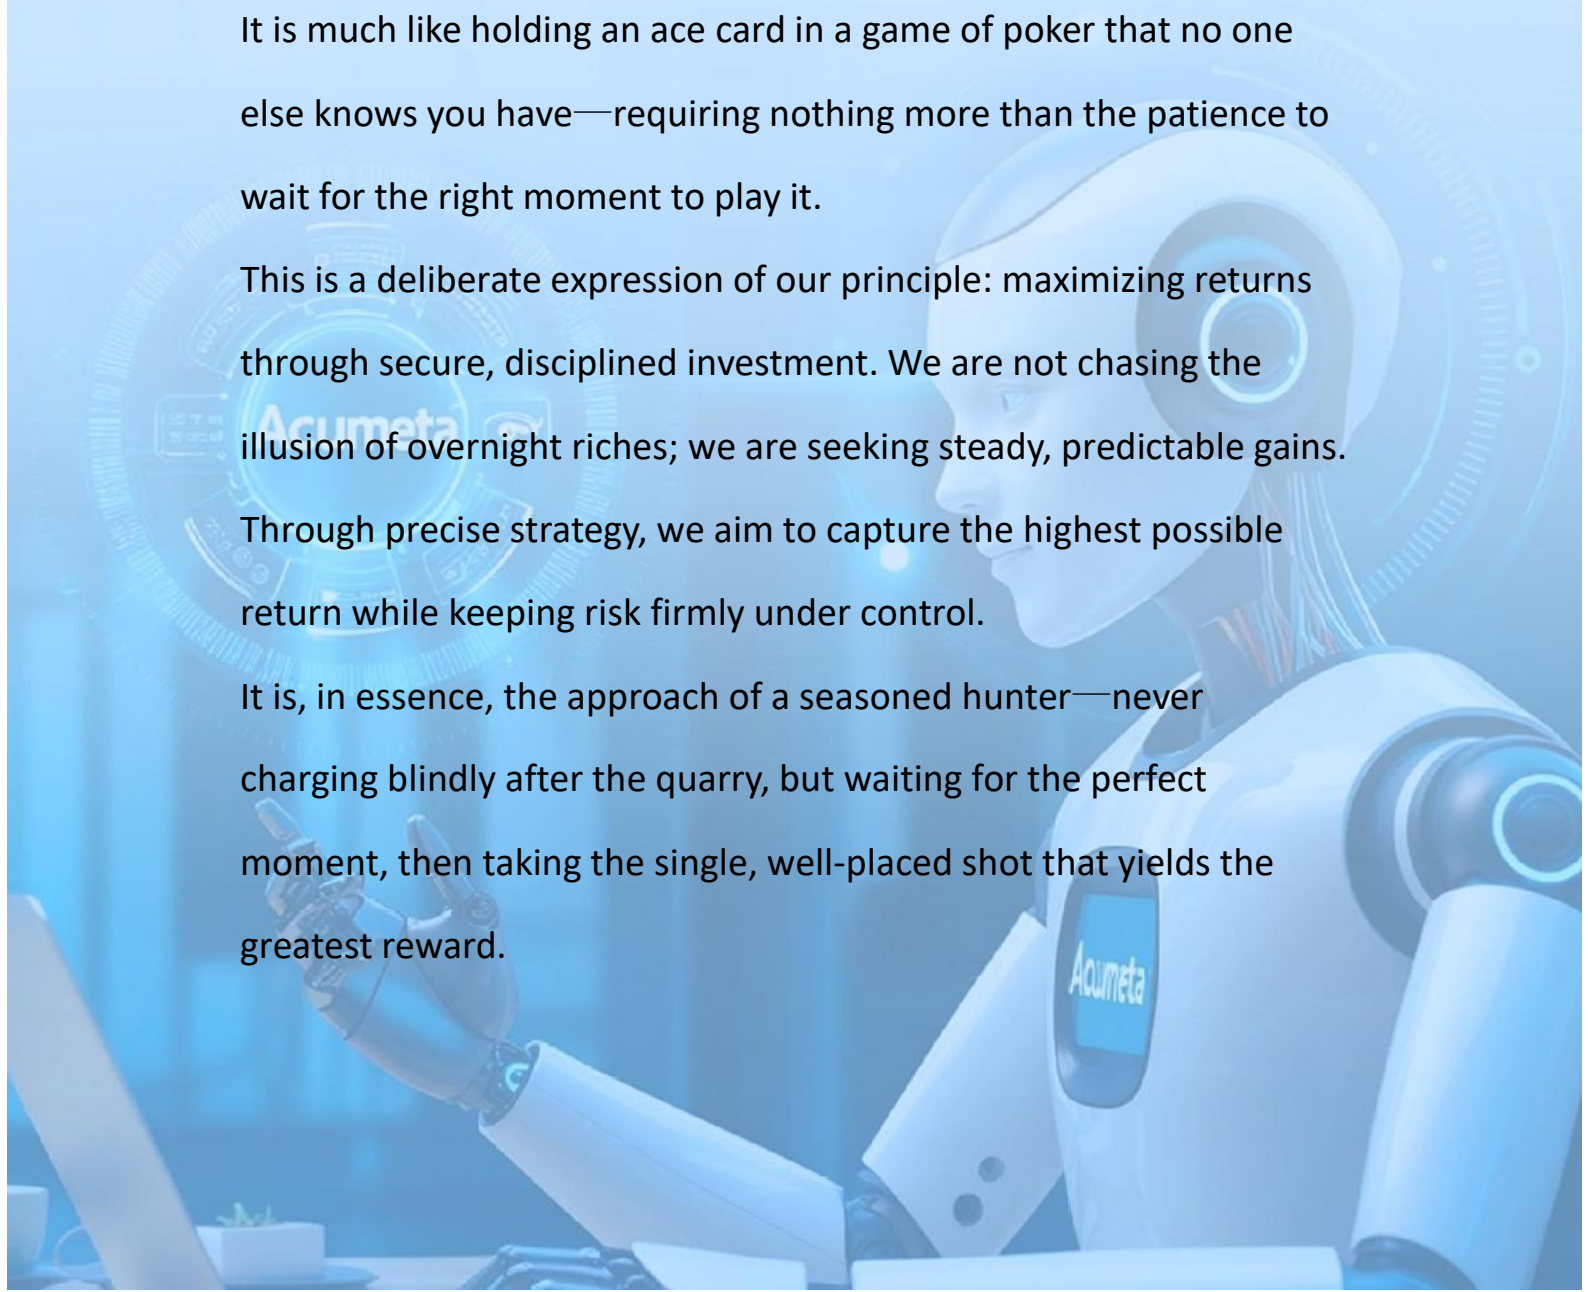

After BLSH completed its IPO on Wednesday and we locked in profits, we once again demonstrated that subscribing to pre-listing shares is the true “ace in the deck.”

It is much like holding an ace card in a game of poker that no one else knows you have—requiring nothing more than the patience to wait for the right moment to play it.

This is a deliberate expression of our principle: maximizing returns through secure, disciplined investment. We are not chasing the illusion of overnight riches; we are seeking steady, predictable gains.

Through precise strategy, we aim to capture the highest possible return while keeping risk firmly under control.

It is, in essence, the approach of a seasoned hunter—never charging blindly after the quarry, but waiting for the perfect moment, then taking the single, well-placed shot that yields the greatest reward.

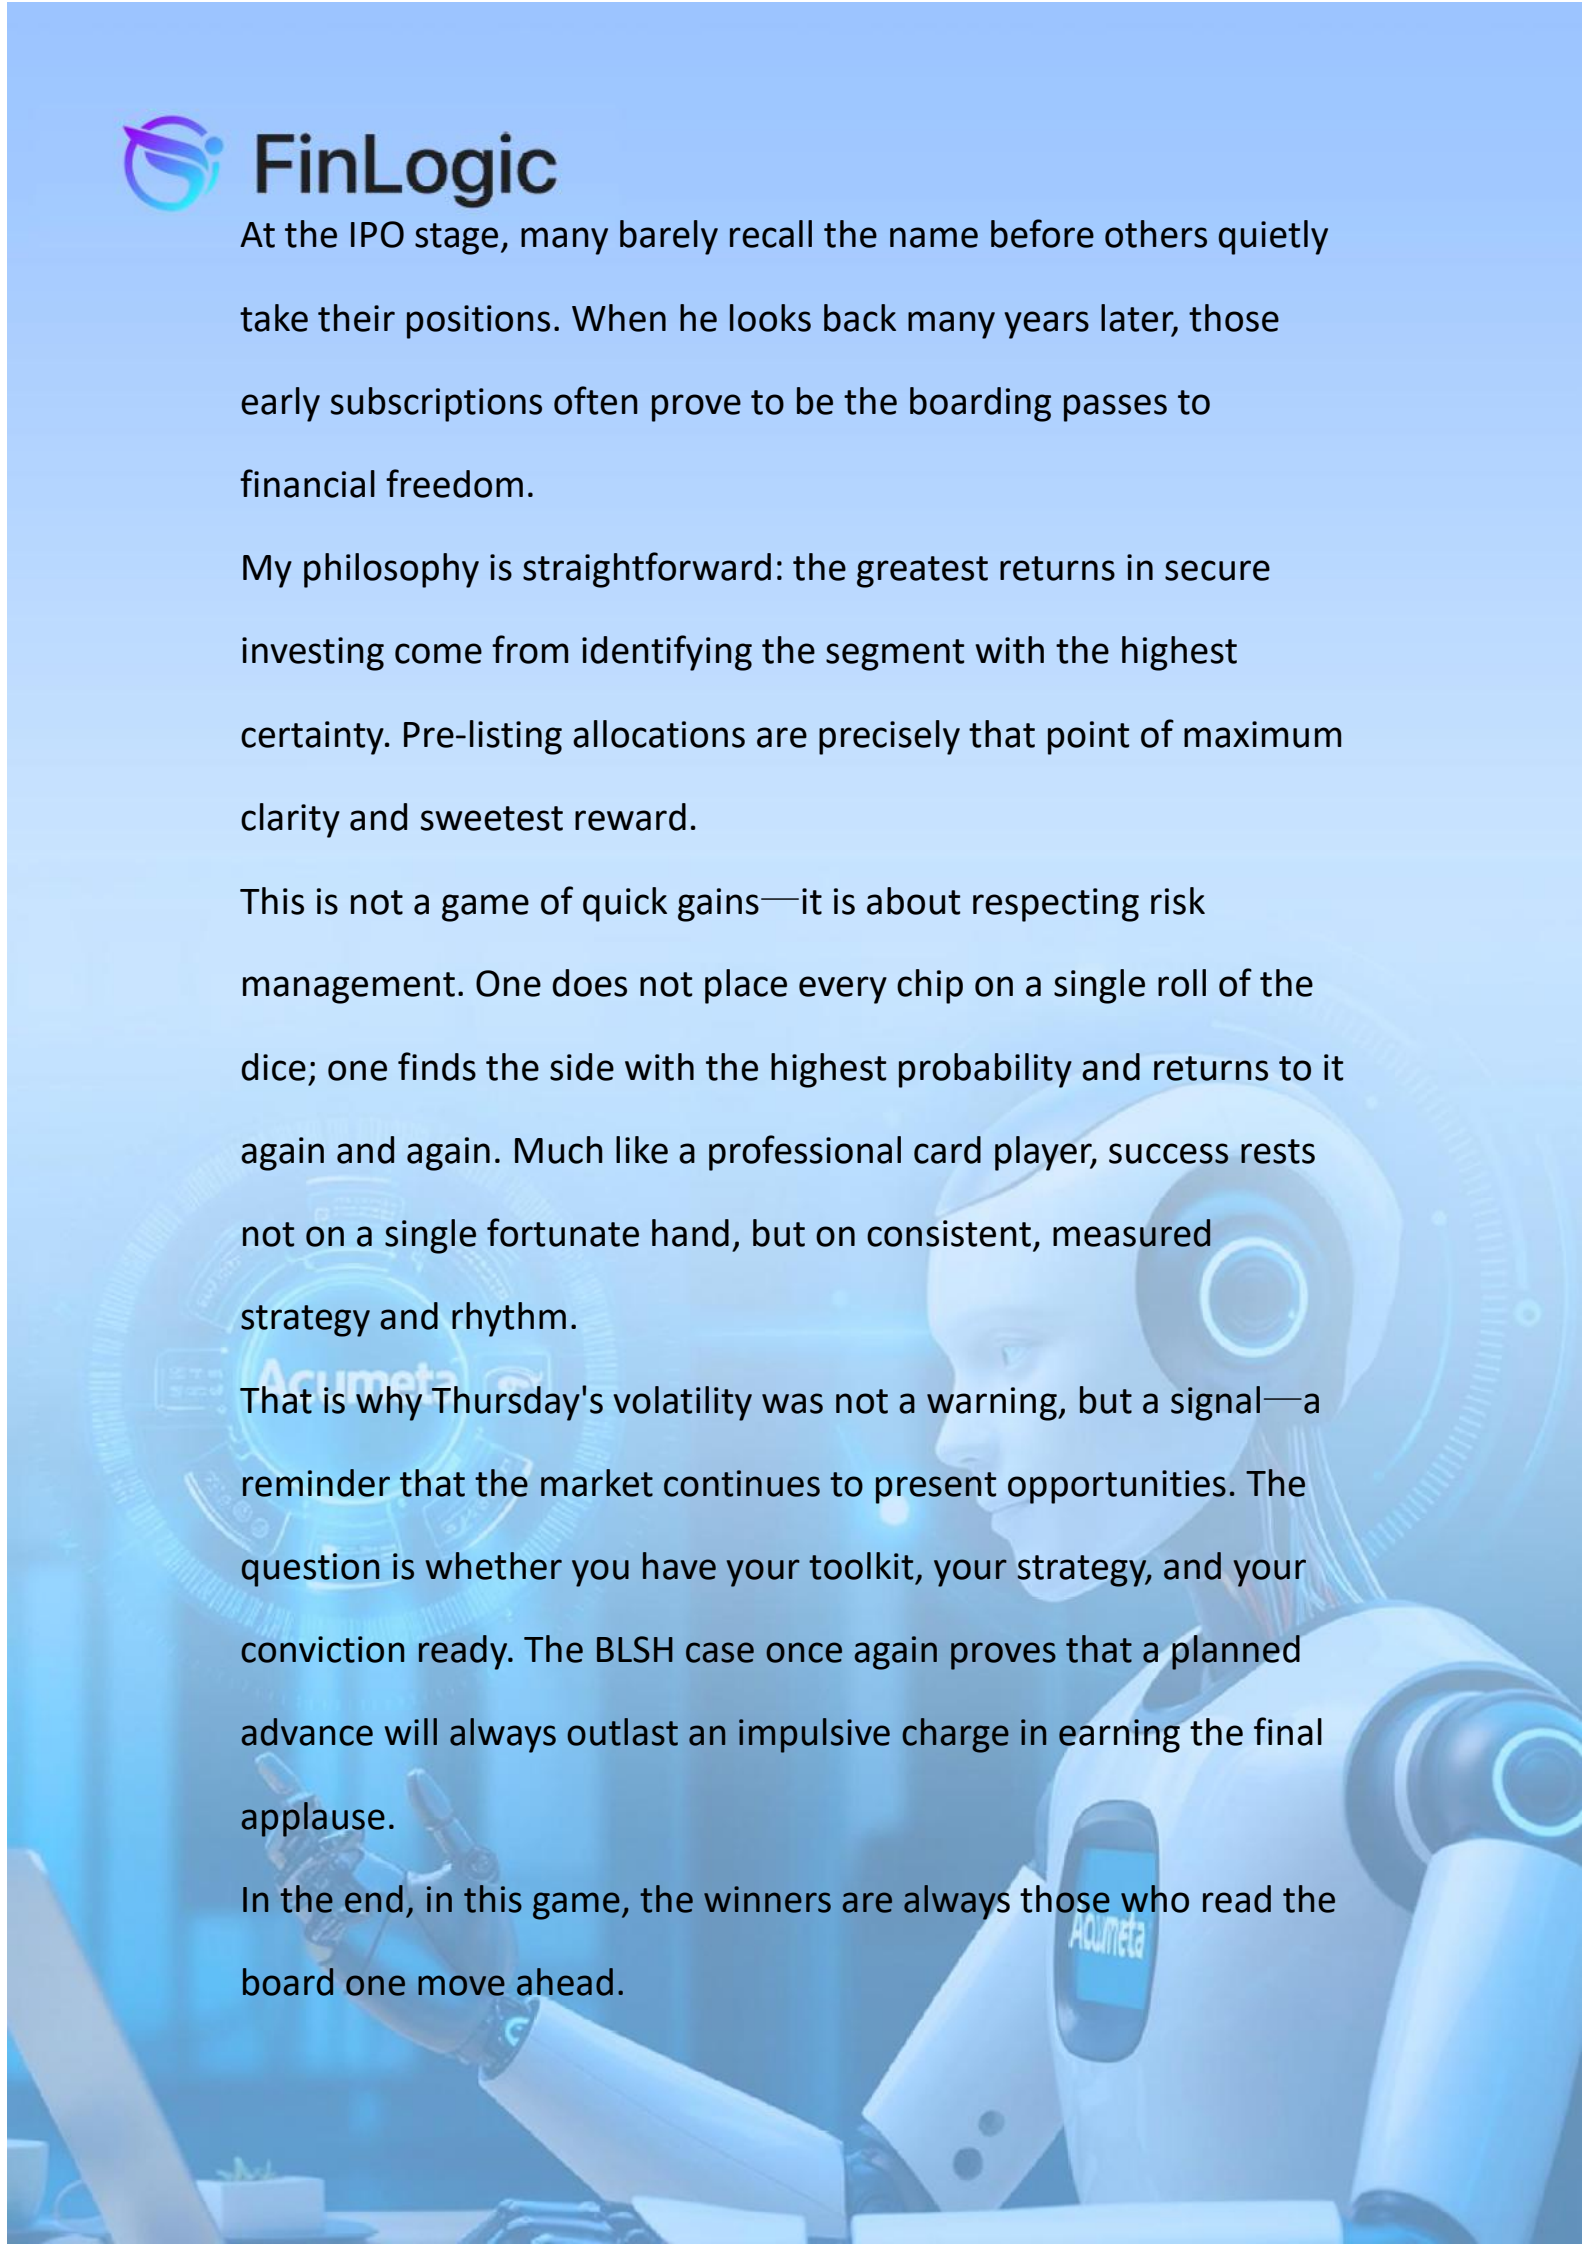

At the IPO stage, many barely recall the name before others quietly take their positions. When he looks back many years later, those early subscriptions often prove to be the boarding passes to financial freedom.

My philosophy is straightforward: the greatest returns in secure investing come from identifying the segment with the highest certainty. Pre-listing allocations are precisely that point of maximum clarity and sweetest reward.

This is not a game of quick gains—it is about respecting risk management. One does not place every chip on a single roll of the dice; one finds the side with the highest probability and returns to it again and again. Much like a professional card player, success rests not on a single fortunate hand, but on consistent, measured strategy and rhythm.

That is why Thursday's volatility was not a warning, but a signal—a reminder that the market continues to present opportunities. The question is whether you have your toolkit, your strategy, and your conviction ready. The BLSH case once again proves that a planned advance will always outlast an impulsive charge in earning the final applause.

In the end, in this game, the winners are always those who read the board one move ahead.

With the successful close of BLSH's IPO, this chapter in the capital markets served as a real-world masterclass in investing—one that conveys a simple yet enduring truth: whether in equities or in new token STO projects, true value often emerges in those moments when only a few have the conviction to move early.

As the old saying goes, the early bird gets the worm—but the wise bird gets the fattest one. The story of BLSH is the perfect distillation of that “fat worm” moment.

BLSH's IPO was not merely a listing; it was the validation of an investment philosophy—the trinity of information, timing, and execution. Before the bell rang, there were doubts and debates about its prospects. Yet at the very moment trading began, price and volume silenced all skepticism.

The logic here is not unlike the period before Apple unveiled its first iPhone. Many dismissed it as just “a phone with a touch screen,” but those who recognized it as the gateway to the future—and bought in during its price trough—now look back on gains that speak for themselves.

At present, while subscriptions for our new token STO have yet to officially open, we hold in hand an exceptionally reliable guide—

much like a map leading directly to a treasure island. Astute investors understand that wealth is not built by sprinting from the starting line, but by setting one's course long before the track is even laid.

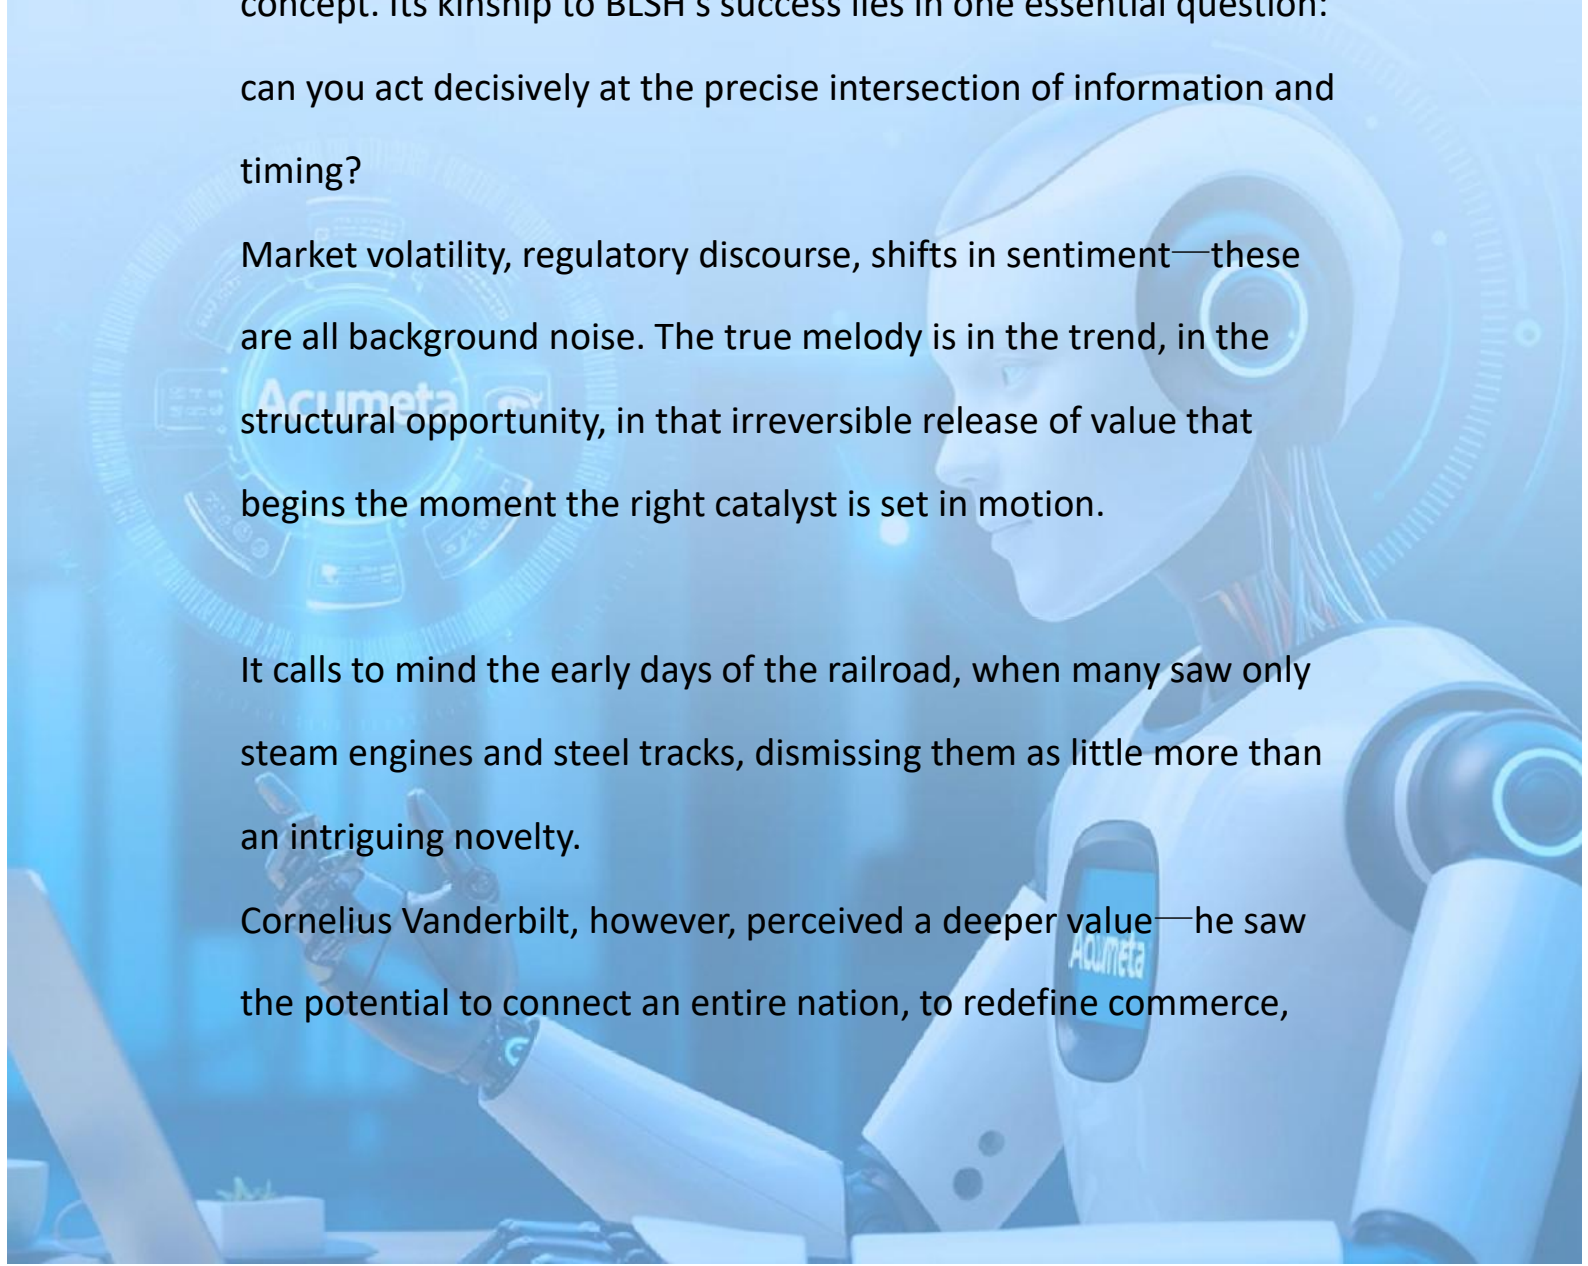

Throughout history, every great investment opportunity—whether the internet in the 1990s, renewable energy in the early 2000s, or artificial intelligence in recent years—was secured by a prepared few, well before the broader public could see its full shape.

This is why the potential of the STO project is far from a mere concept. Its kinship to BLSH's success lies in one essential question: can you act decisively at the precise intersection of information and timing?

Market volatility, regulatory discourse, shifts in sentiment—these are all background noise. The true melody is in the trend, in the structural opportunity, in that irreversible release of value that begins the moment the right catalyst is set in motion.

It calls to mind the early days of the railroad, when many saw only steam engines and steel tracks, dismissing them as little more than an intriguing novelty.

Cornelius Vanderbilt, however, perceived a deeper value—he saw the potential to connect an entire nation, to redefine commerce,

time, and space itself. His investment was not merely in iron and locomotives; it was in the promise of connection and efficiency for the future.

Our investments should be guided by the same wisdom. A new token STO is, in many ways, the railroad Vanderbilt envisioned. It is not simply a digital asset—it is the foundational infrastructure of tomorrow's financial system, a bridge linking traditional assets with the digital realm.

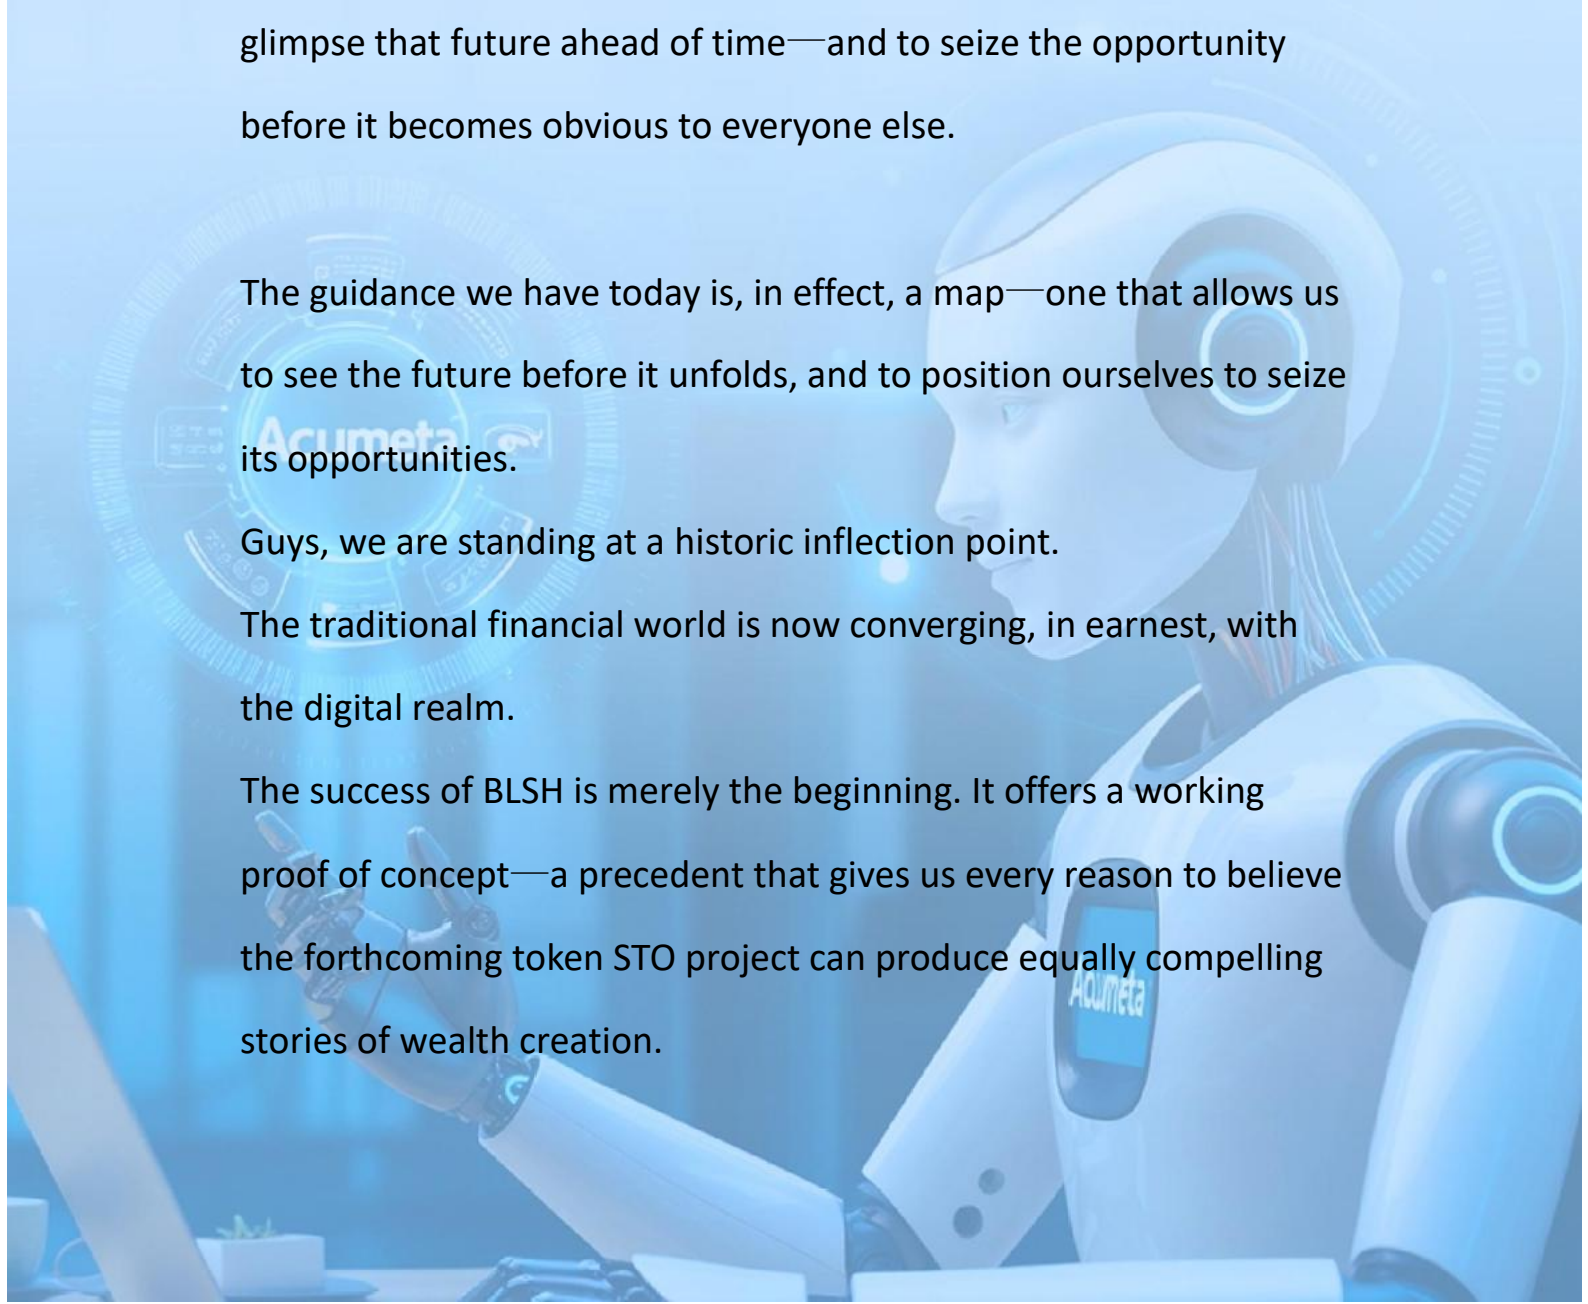

And the guide we got today is, in effect, the map that allows us to glimpse that future ahead of time—and to seize the opportunity before it becomes obvious to everyone else.

The guidance we have today is, in effect, a map—one that allows us to see the future before it unfolds, and to position ourselves to seize its opportunities.

Guys, we are standing at a historic inflection point.

The traditional financial world is now converging, in earnest, with the digital realm.

The success of BLSH is merely the beginning. It offers a working proof of concept—a precedent that gives us every reason to believe the forthcoming token STO project can produce equally compelling stories of wealth creation.

Together, with both discernment and resolve, we can grasp the opportunities this era has laid before us. After all, in the world of capital, prosperity tends to favor those who have set their pieces in place long before the board grows crowded.

Which brings us, inevitably, to the question: what exactly is an STO?

The New Token STO (Security Token Offering) and the New Share IPO (Initial Public Offering) differ in form, yet share a common investment logic.

An IPO—Initial Public Offering—is when a company lists on a securities exchange, offering its “shares” to the public, thereby allowing individuals to become shareholders.

An STO—Security Token Offering—digitizes and tokenizes real-world assets, such as equity in a company, real estate, or fine art, and issues these tokens to investors via the blockchain. Each token represents ownership of the underlying asset

While the structures differ, the investment essence remains the same: by purchasing the asset, the investor becomes an owner—whether of a business or a tangible asset—with the expectation of future returns.

A critical shared feature in the subscription phase: cost advantage as the core.

In both IPOs and STOs, the subscription process carries one decisive commonality—the ability to secure a cost advantage. It is akin to a major auction where, instead of entering the bidding war after the crowd has driven up the price, you have secured the piece in advance, at a prearranged and favorable price.

Why is this cost advantage so critical?

Risk Hedging: Acquiring shares or tokens at a subscription price provides a natural “safety cushion.” Should the price decline after listing, your downside is materially less than that of those who bought in the secondary market at a premium.

Maximizing Returns: Suppose you subscribe at \$10, and the price rises to \$20 post-listing—you've effectively secured a 100% gain from the outset, a margin unavailable to those chasing higher prices later in the market.

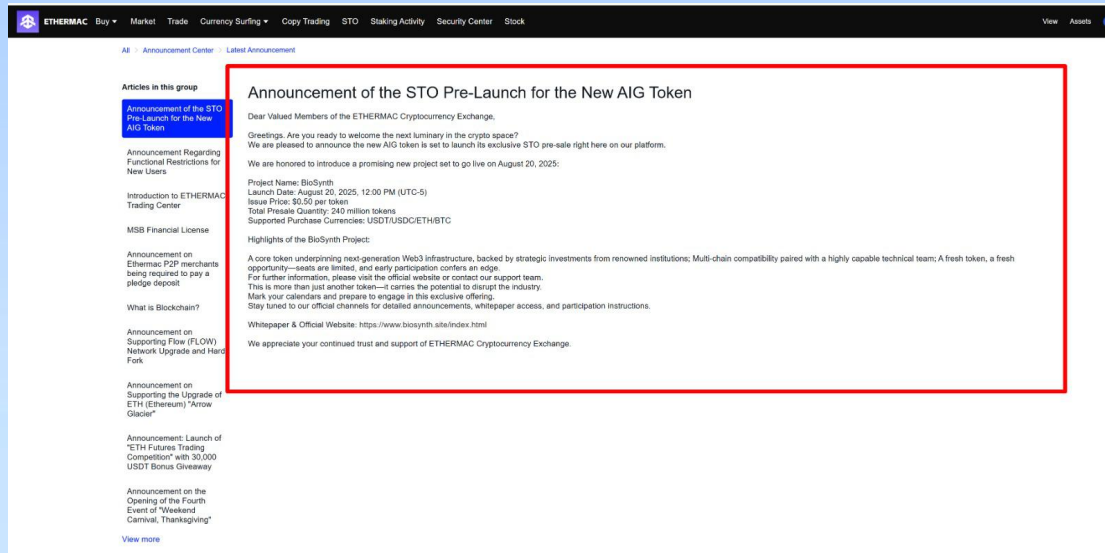

Immunity from Market Whiplash: Subscription investing is grounded in fundamental analysis and disciplined entry. You are not compelled to make decisions amid the euphoria or panic of market sentiment. Instead, you lock in your position at the most favorable terms from the very beginning.

The successful IPO of BLSH was far more than a singular win for the traditional financial sphere. It conveyed a strong market signal and

FinLogic

offered the STO market a compelling “proof of concept.” While the underlying technologies differ, the investment logic—gaining a cost advantage through early subscription—remains identical.

Today's announcement from the ETHERMAC Cryptocurrency Exchange regarding the new token STO signals a fresh opportunity.

Yet this opportunity has not officially launched, giving everyone ample time to prepare.

I trust that by following the community program today, you have absorbed knowledge that will prove directly applicable in real-world execution.

The significance of an STO lies in its ability to break down traditional financial barriers, making investment simpler, more transparent, and more efficient. Traditionally, investing in a promising startup or purchasing a piece of prime commercial real estate demanded substantial capital—and often required accredited investor status.

Opportunities for the average person were, frankly, minimal.

An STO allows these high-value assets to be “sliced” into smaller portions, each represented by a digital token. For example, with \$100, you could acquire 0.01% ownership of a property valued at \$1 million. This innovation opens the door for ordinary investors to participate in opportunities once reserved exclusively for the wealthy.

Imagine you are the CEO of a successful startup. Your company is profitable, yet you prefer not to raise capital through a traditional IPO—it's cumbersome, costly, and time-consuming.

Under the STO model, you can tokenize your company's equity into one million digital tokens. These tokens can then be offered directly to investors around the world via an STO platform.

Because these tokens represent actual securities, they are subject to regulation by U.S. authorities such as the MSB, providing legal safeguards for investors.

As the chart illustrates, my token, FGT, clearly displays in the white paper both the allocation within the STO and the portion currently circulating in the market. Meanwhile, certain key institutional holdings remain locked, sending a strong signal of market security. This structure, supported by robust governance, often provides a healthy guide for fundraising within blockchain projects.

On Wall Street, there's an old saying: “Opportunity doesn't knock twice, but it might send you a heads-up text first.”

That adage fits perfectly with today's topic—drawing lessons from the success of a new stock IPO and projecting them onto the future potential of a new token STO.

Remember the BLSH listing? During the subscription phase, many in the market hesitated, uncertain and reluctant to act. The result? At launch, it shot up like a Las Vegas fireworks display, delivering not just applause but substantial returns to those who secured their shares early. This is the magic of the primary market—you don't chase the price after it rises; you position yourself ahead of the starting gun.

This logic holds not only in equities but also in the world of STOs. An STO—Security Token Offering—essentially transfers the regulatory framework of traditional securities onto the blockchain,

FinLogic

making investing more efficient, transparent, and accessible.

Subscribing early is much like pre-ordering in an IPO—you secure stakes at a price lower than the secondary market.

You're the one seated in the front row before the concert starts, not the person still in line an hour into the show.

I understand—facing something new, especially a blockchain security like an STO, many react with fear: it seems complex, unfamiliar and risky. But friends, fear has never made anyone money; learning does. Imagine, if you could, like those early believers in Amazon e-commerce, place your trust in the rise of a regulated on-chain security and lock in your position before the launch, your story could very well become another legend in the investment world of tomorrow.

So next week, we're not merely spectators—we are participants.

The insights shared in the program are your intelligence; your task is to turn them into action. Don't wait until the music of opportunity stops only to find yourself still standing outside the door. Learn it today, apply it tomorrow, and let it generate wealth for you the day after. That is the very reason we sit here—not just to witness the world's changes, but to be the ones driving them.

And we, as witnesses and participants of this era, should never be mere bystanders.

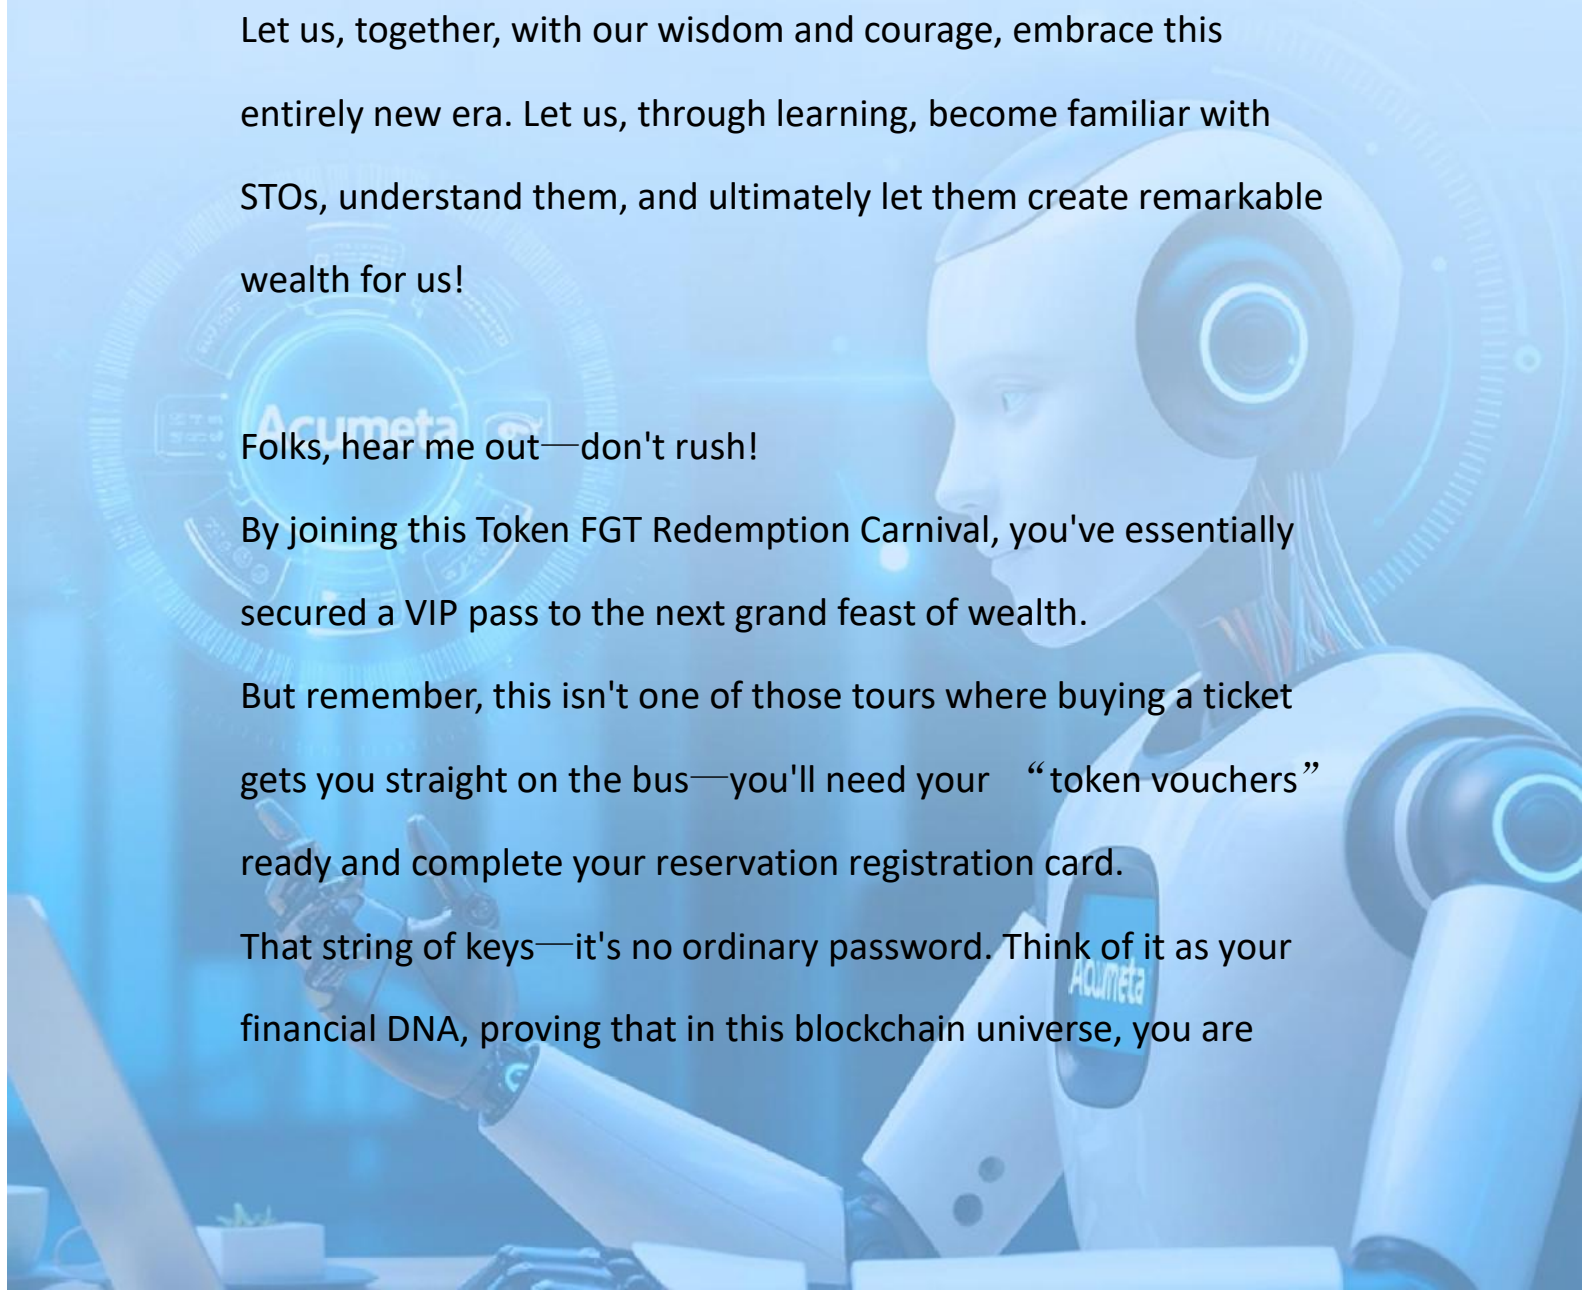

Let us, together, with our wisdom and courage, embrace this entirely new era. Let us, through learning, become familiar with STOs, understand them, and ultimately let them create remarkable wealth for us!

Folks, hear me out—don't rush!

By joining this Token FGT Redemption Carnival, you've essentially secured a VIP pass to the next grand feast of wealth.

But remember, this isn't one of those tours where buying a ticket gets you straight on the bus—you'll need your “token vouchers” ready and complete your reservation registration card.

That string of keys—it's no ordinary password. Think of it as your financial DNA, proving that in this blockchain universe, you are

unmistakably, uniquely you.

We wrapped up redemptions on August 18, and the excitement is still fresh in our minds; but the real show—subscription for the new token—kicks off on August 20.

It's like the night before the Super Bowl: the streets are buzzing, but the whistle hasn't blown yet.

And this time, the arena isn't just any stadium—it's the global capital arena on the blockchain.

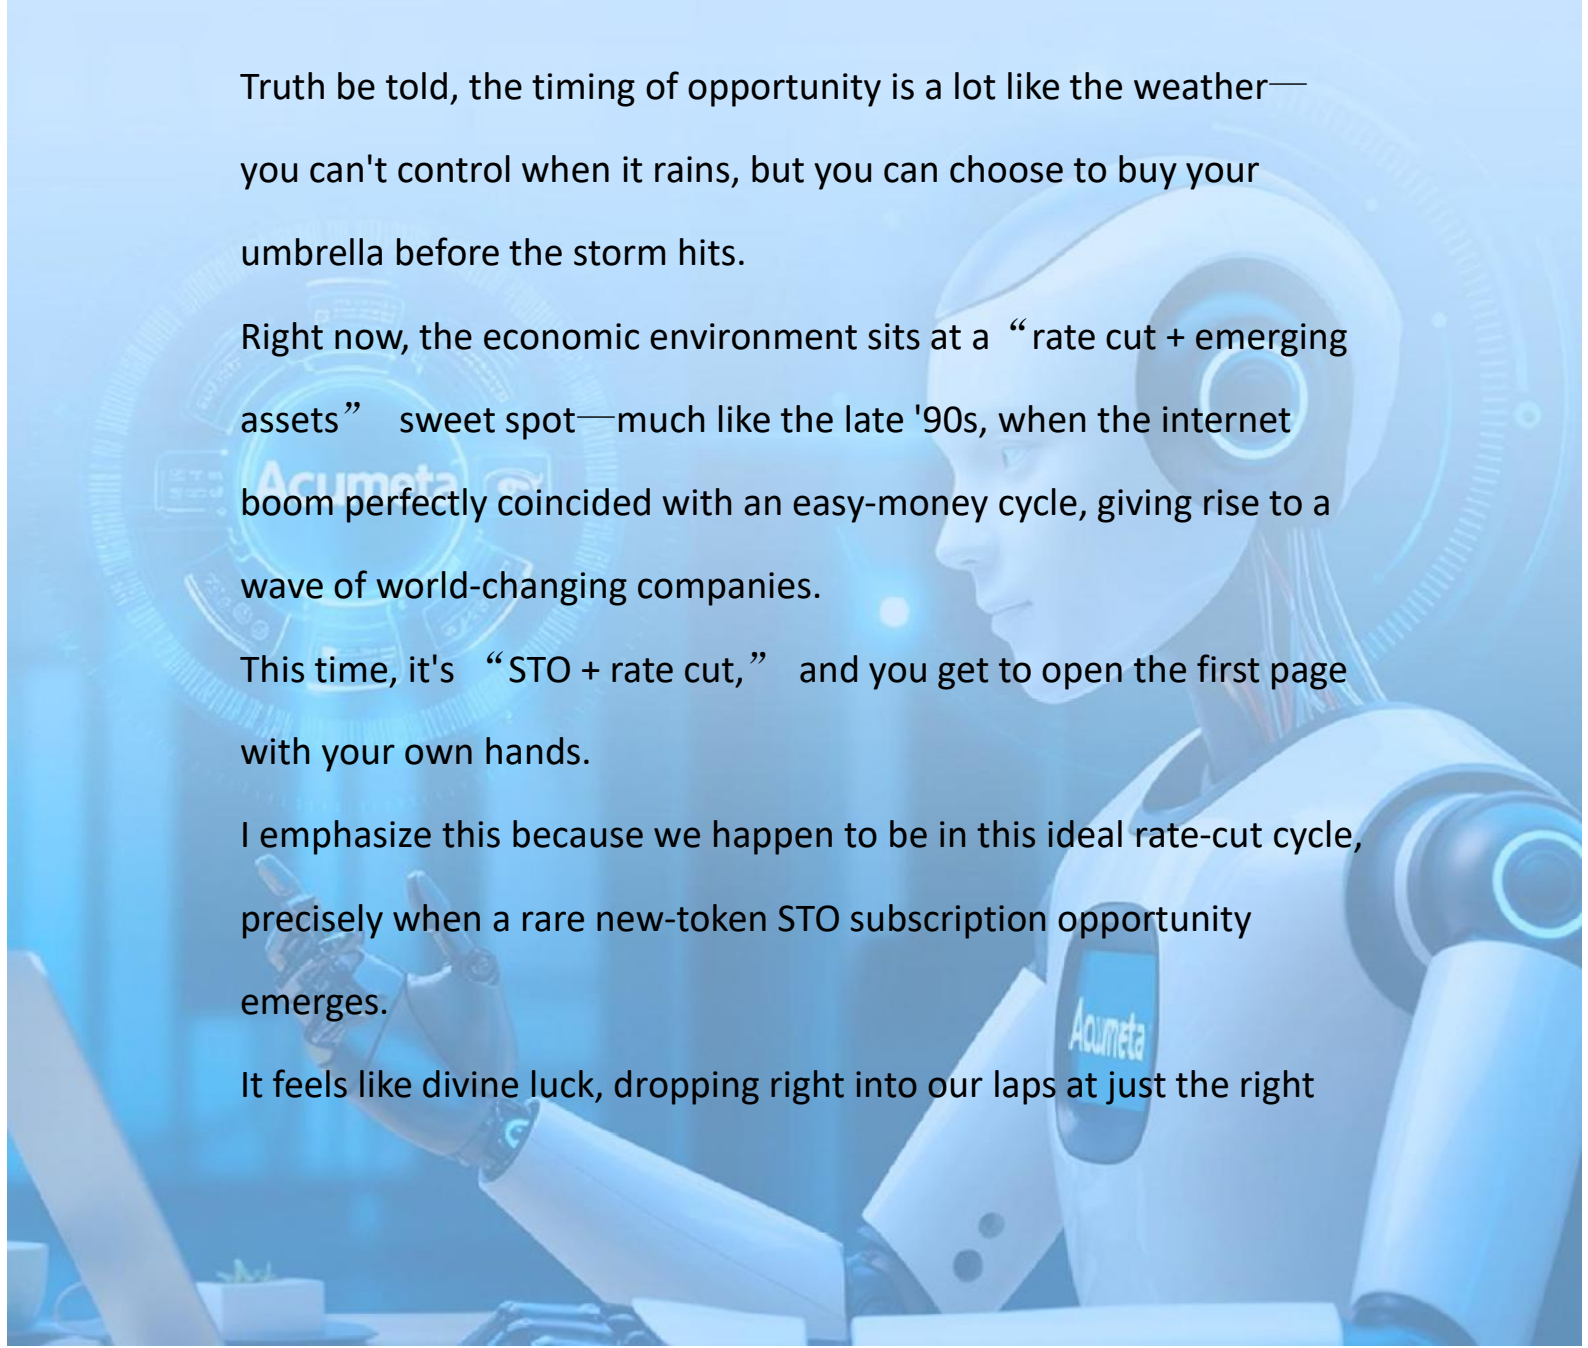

Truth be told, the timing of opportunity is a lot like the weather—you can't control when it rains, but you can choose to buy your umbrella before the storm hits.

Right now, the economic environment sits at a “rate cut + emerging assets” sweet spot—much like the late '90s, when the internet boom perfectly coincided with an easy-money cycle, giving rise to a wave of world-changing companies.

This time, it's “STO + rate cut,” and you get to open the first page with your own hands.

I emphasize this because we happen to be in this ideal rate-cut cycle, precisely when a rare new-token STO subscription opportunity emerges.

It feels like divine luck, dropping right into our laps at just the right

moment.

Some ask me if this is God's favor. I say, God may not hand out checks often, but He certainly likes to place opportunity in front of you—and see if you dare reach for it.

Today, you not only have the right to reach—but you also know exactly where to extend your hand. That in itself is the start of good fortune.

So don't just sit on the couch nodding along to the show—this is a real battlefield for wealth. Don't miss it. Tomorrow, Friday, we'll wrap up the week with a brilliant recap of our wins. Until then!

P.S. Today's quiz comes with rewards—participate in the Token Redemption Carnival survey!
