

FinLogic

Monday, Aug 25, 2025

Ladies and gentlemen, & esteemed supporters of the AIG project:
Monday mornings often carry the sense of a new season's opening kick-off.

Last Friday, the Chairman of the Federal Reserve finally set aside the hawk's stance and assumed the dove's feathers, delivering to the market a signal as unambiguous as one could imagine: a September rate cut is now all but certain.

Some may be tempted to regard this as a complimentary lunch ticket, but the discerning know better, there is no such thing as a free lunch. Only those who place their order in advance are served the finest portion.

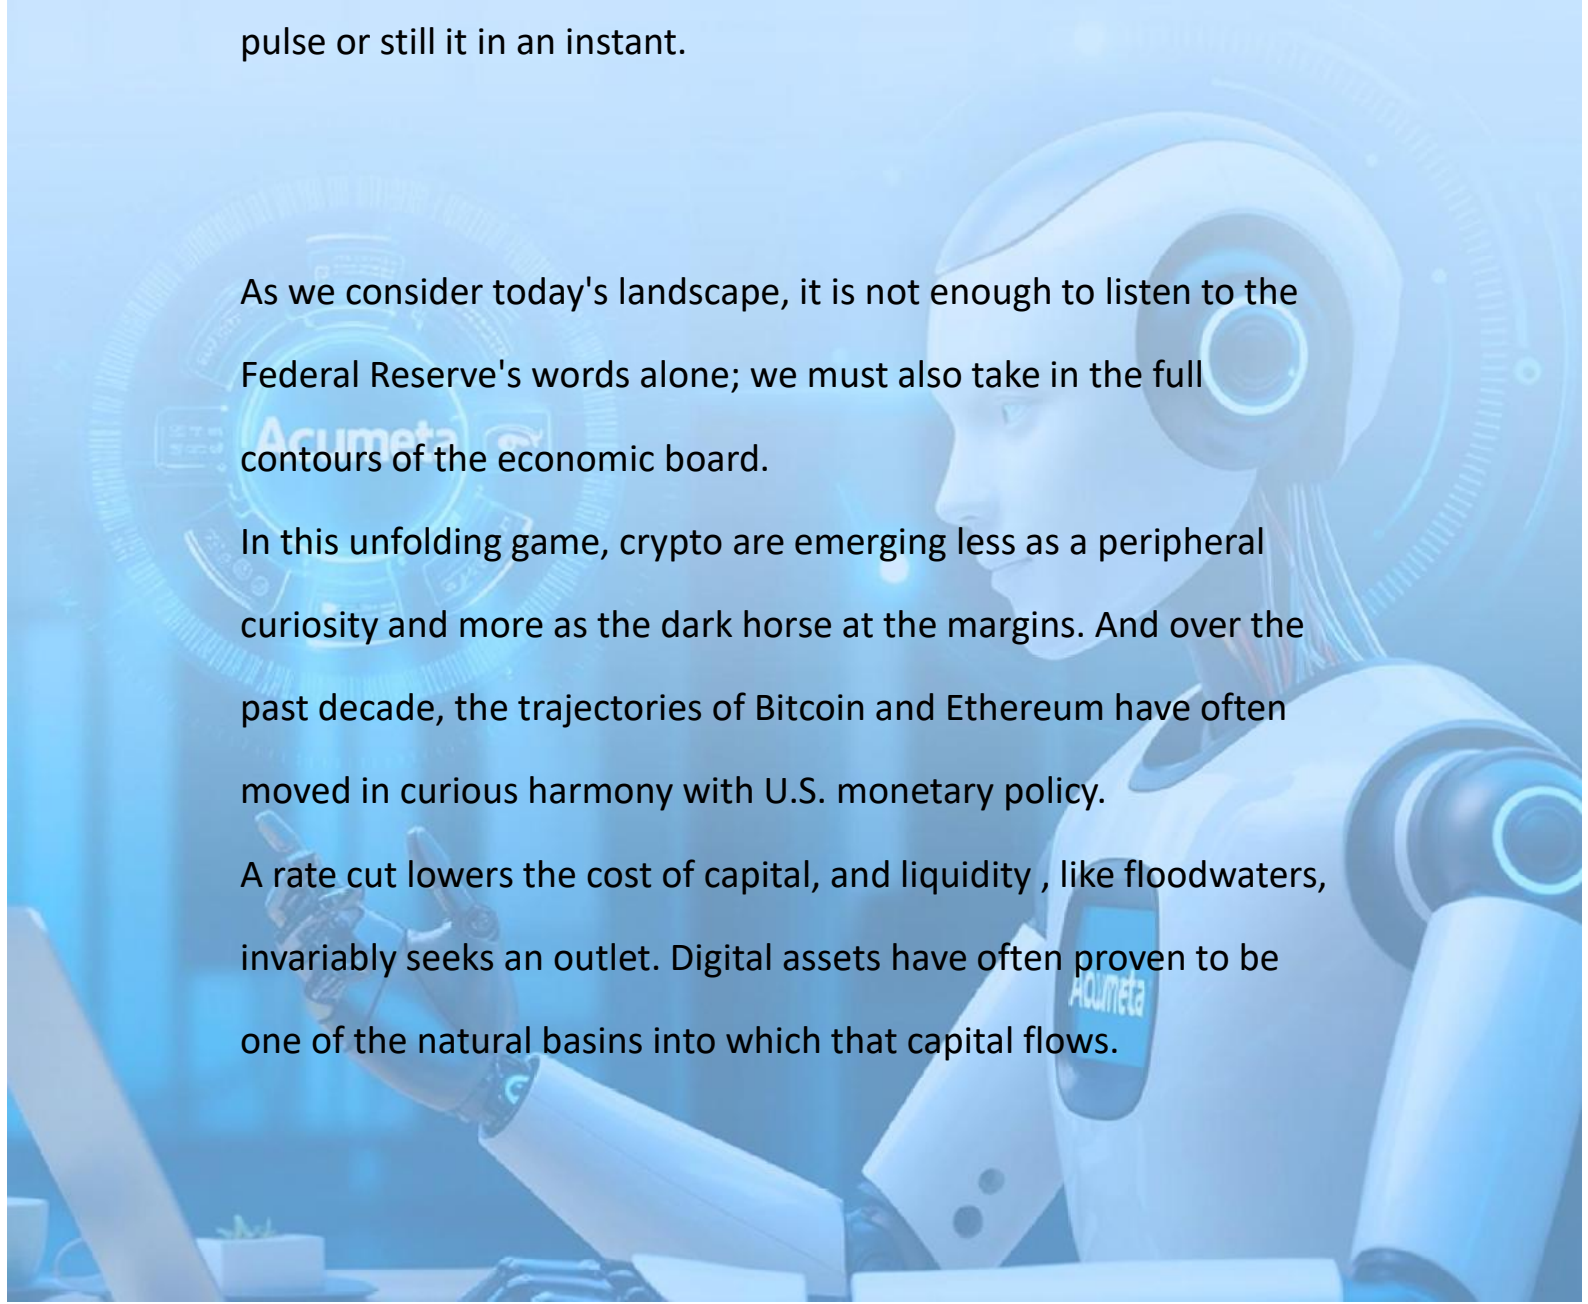

Which brings us to the essential question: on the eve of easing, how do we position ourselves for the opening moves in this next chapter of wealth management?

American history offers no shortage of precedents. Recall the 1980s, when Paul Volcker confronted inflation with an iron hand, sending interest rates soaring to the skyline. Or the Greenspan era that followed, when aggressive rate cuts helped fuel the exuberance of the 1990s internet boom. Interest rates, in every era, have functioned as an invisible controller —able to quicken the market's pulse or still it in an instant.

As we consider today's landscape, it is not enough to listen to the Federal Reserve's words alone; we must also take in the full contours of the economic board.

In this unfolding game, crypto are emerging less as a peripheral curiosity and more as the dark horse at the margins. And over the past decade, the trajectories of Bitcoin and Ethereum have often moved in curious harmony with U.S. monetary policy.

A rate cut lowers the cost of capital, and liquidity, like floodwaters, invariably seeks an outlet. Digital assets have often proven to be one of the natural basins into which that capital flows.

📅 Crypto Weekly Digest | Ethereum's \$4958 New All-Time-High

Quotes

Just look at Ethereum last week, it was like a candle lit against the night sky, reminding us that the faith sustained on-chain and the

policies enacted in the real economy have long since entered into dialogue.

And the subscription progress of AIG's new token resembles a report card, making clear that this is not the undertaking of a few participants alone. In truth, it is an unspoken celebration on-chain — a tacit acknowledgment shared among investors worldwide.

I am aware that some will debate whether the coming rate cut is driven more by politics than by economic data. But, folks, I do not wish to argue over that today. What matters is finding, amid the movements preceding this rate cut, the true avenues for wealth to appreciate. What I wish to convey is simple, whatever reason the rain falls, we must be prepared to receive the drops of prosperity it carries with it!

It calls to mind a classic story from our own history. During the California Gold Rush of the 19 century, most prospectors dug feverishly along riverbeds, chasing gold with little more than hope. Yet one shrewd merchant chose a different course. Instead of panning for gold himself, he sold maps and tools to those who did. He understood that fortune favors wisdom and preparation over blind chance. In the end, he became one of the wealthiest men of his age.

We, too, are not blindly chasing uncertain headlines. We are applying judgment, seeking the opportunities most likely to yield enduring returns. Every decision we make is a deliberate step in paving the road to our future.

And so, rather than be lost in the noise of traditional finance, we turn toward the promise of our own digital reserves. I invite you to join me in carrying forward the momentum of the AIG token subscription, and together, let us open a new chapter of investment with renewed confidence and purpose.

In his speech last Friday, Chair Powell struck a tone more dovish than markets had expected. He emphasized that the 'balance of risks is shifting,' acknowledged the resilience of the economy but noted rising downside risks, and indicated that rate cuts may 'soon be necessary.' He also mentioned the inflationary pressures arising from tariffs, suggesting support for easing as a countermeasure. Taken together, I see 3 key points that make this the decisive signal for a September cut.

Importantly, Powell did not rule out the possibility of a 50 bp reduction in September — a remark that markets quickly interpreted as dovish. With only a few months remaining in his term, the responsibility for policy will soon pass to his successor.

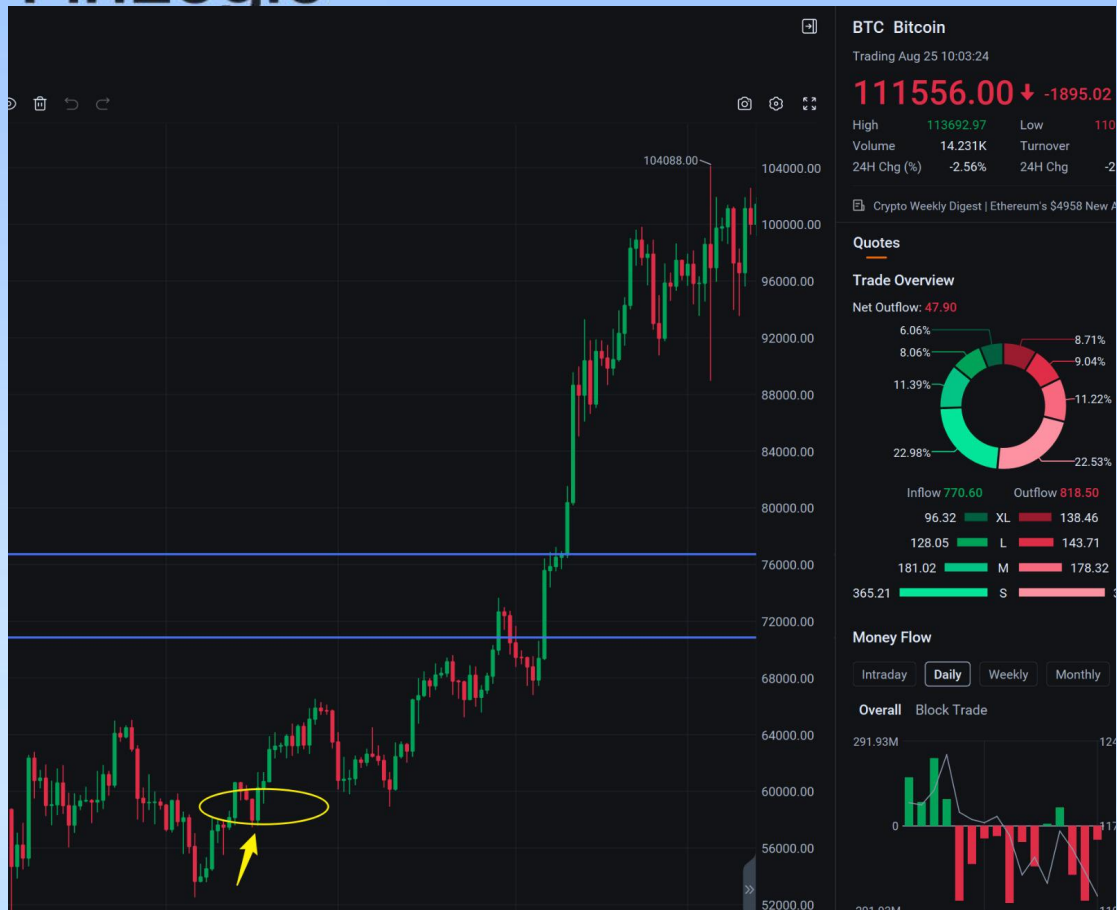

We should therefore focus on the upcoming data: the August nonfarm payroll report, due September 5, and the August CPI, due September 11, these figures will provide the critical basis for the FOMC's decision at its September 17 – 18 meeting.

U.S. equities declined in pre-market trading on Monday, reflecting the market's concern that a weakening labor environment ahead of the September rate cut may signal rising recession risks. At the same time, this underscores that the true purpose of easing is to release liquidity, yet for businesses, the critical step is to leverage lower financing costs into growth, and in turn, into stronger employment.

Looking back at 2024, we saw a similar decline in U.S. equities from August 20 to September 6, as these very concerns spread through the market. So, in the near term, therefore, trading opportunities in equities are likely to be scarce. For now, our focus will remain on investments that emphasize stability, and in this environment, that means participation in the 0 risk STO subscription of the new token.

History has a way of offering us both satisfying answers and new insights!

Looking back to 2024, my conclusion at that time was that Bitcoin would emerge as a focal point for wealth transfer. And the outcome confirmed that view, Bitcoin surged from \$60k to \$102k, and stands today at \$112k

So, why did I anticipate a rise in Bitcoin's price ahead of the September rate cut? Three reasons stood out:

1. In an election year, President Trump's [pro-crypto statements] served as a powerful catalyst for market sentiment.
2. Rate cuts are akin to the Fed loosening the monetary “faucet,”

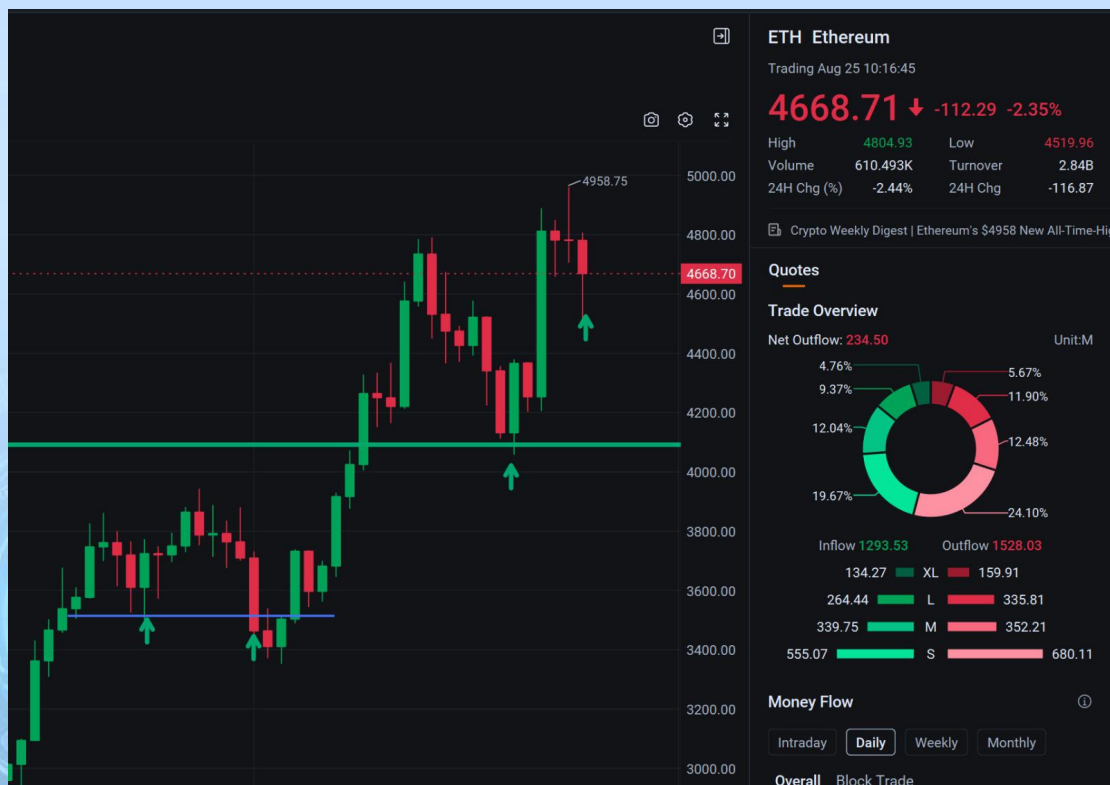

FinLogic

unleashing a long-suppressed flood of liquidity. Bitcoin, in this context, stands as the new frontier — vibrant and full of potential.

3. The launch of Bitcoin ETFs drew institutional capital into the market, marking an important inflection point in the era of institutional reserves.

So, as this September's rate cut approaches, the question is what prudent reserve decision I will make this time.

On the eve of the Fed's September 2025 rate cut, this is no ordinary financial gala. It is closer to a grand performance of wealth transfer in which all are participants.

Beyond Bitcoin, which continues to hold its throne as 'digital gold,' ETH is quietly emerging as the new favorite of institutions — even serving as a barometer for the direction of capital flows. As the

saying goes, 'where the wind blows, the herd will follow.' And this time, the wind is blowing toward Ethereum.

Why is that?

First, ETH's value proposition rests on more than speculation.

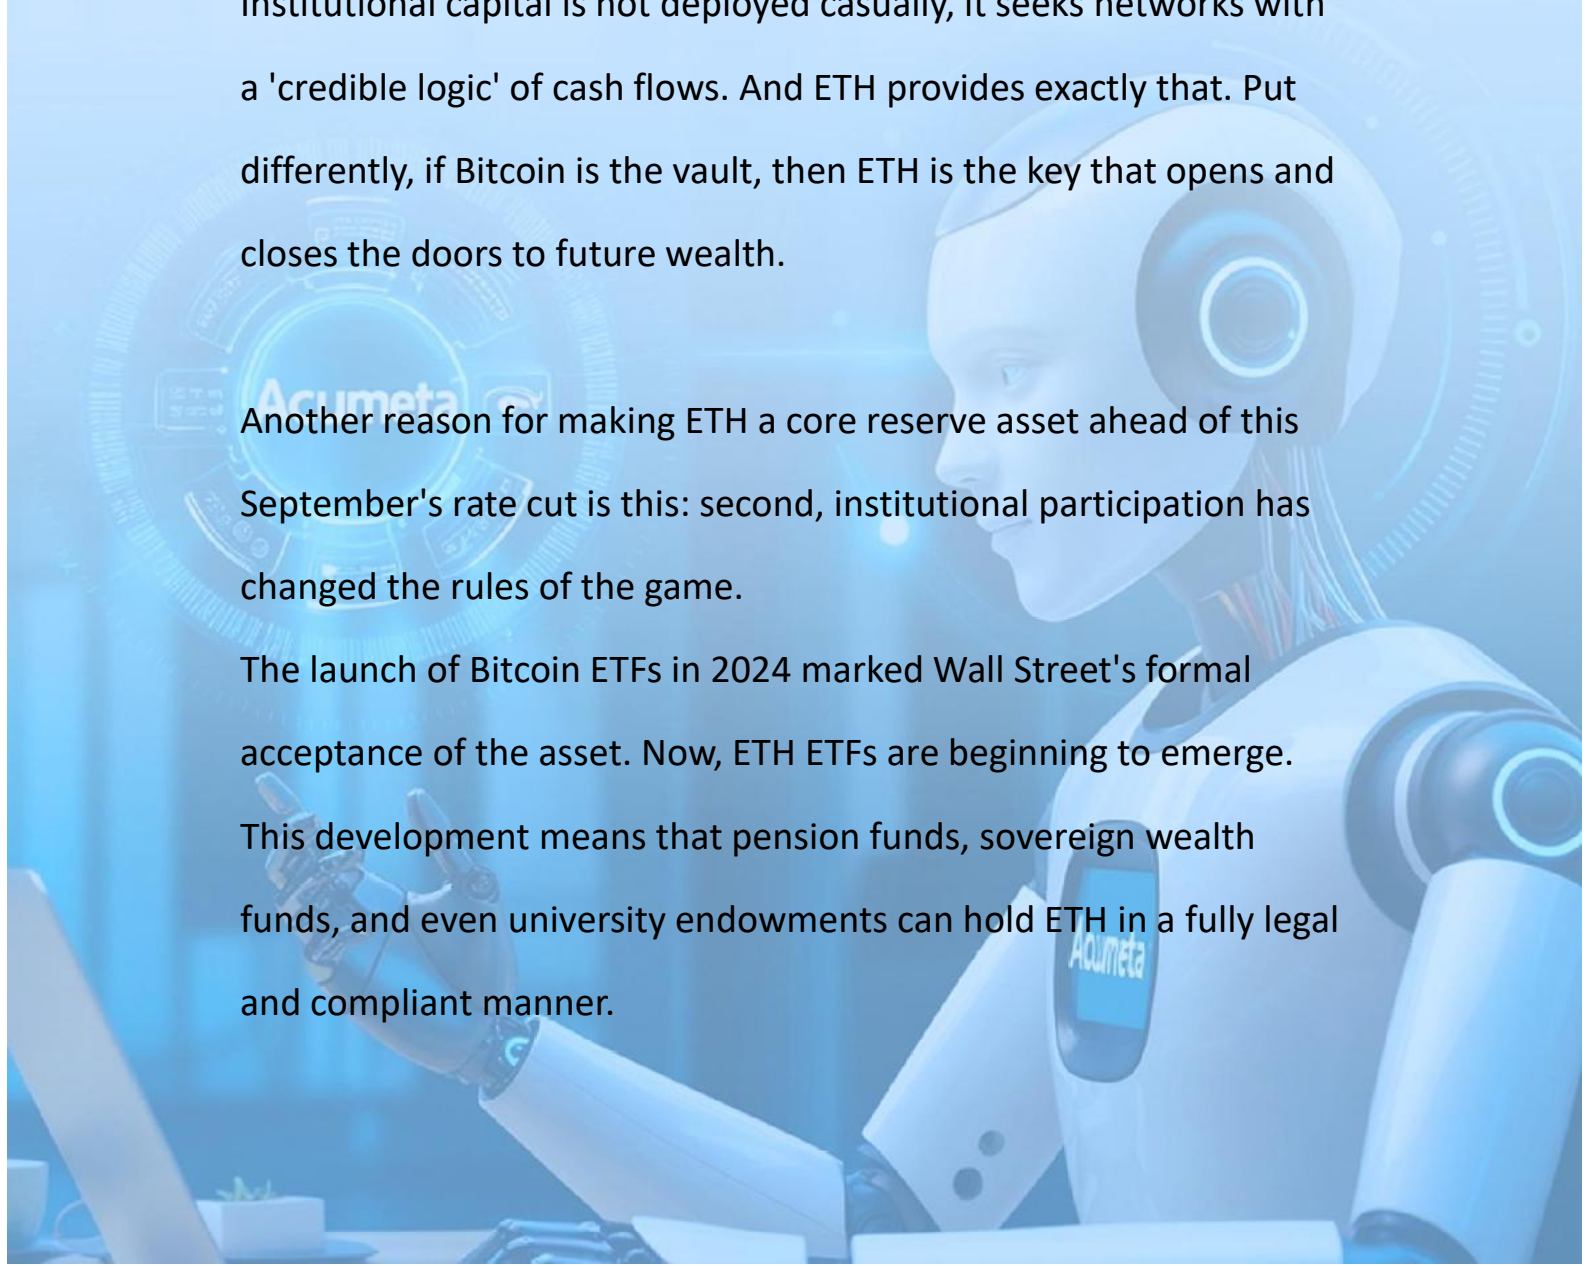

Bitcoin functions primarily as a store of value, while ETH is the operating system of the entire crypto economy. Whether in DeFi's financial applications, the cultural momentum of NFTs, or even experiments at the intersection of AI + blockchain, much of it takes place within the ETH ecosystem.

Institutional capital is not deployed casually, it seeks networks with a 'credible logic' of cash flows. And ETH provides exactly that. Put differently, if Bitcoin is the vault, then ETH is the key that opens and closes the doors to future wealth.

Another reason for making ETH a core reserve asset ahead of this September's rate cut is this: second, institutional participation has changed the rules of the game.

The launch of Bitcoin ETFs in 2024 marked Wall Street's formal acceptance of the asset. Now, ETH ETFs are beginning to emerge.

This development means that pension funds, sovereign wealth funds, and even university endowments can hold ETH in a fully legal and compliant manner.

It recalls the 1960s, when American universities began investing heavily in technology stocks, laying the foundation for Silicon Valley's eventual rise. Today, ETH may well be retracing that history: evolving from a 'geek's experimental token' into an institutional core asset. It is not merely an asset, it is a platform, an infrastructure, a future! It shows us that the true transfer of wealth is moving away from traditional 'savings' toward 'value-creating reserves!

Therefore, my decision on ETH is this: below \$5,000 per coin lies an exceptional entry opportunity. Remember this — one day in the future, you will recall this price, but you will never see it again, just as you can no longer find Bitcoin at \$50k or \$60k!

The great tides of wealth in history reward foresight combined with decisive action. Yet such foresight is not a mystical gift, it often favors those who act without delay. Indeed, acting promptly is success's most reliable ally.

Moreover, ETH not only circulates against USDC but can also be exchanged back into USDC. This ensures that your on-chain reserves can seamlessly transform — from wallet to market trading, to subscription of the new AIG token. In plain terms, the free convertibility enabled by blockchain technology is nothing less than

FinLogic

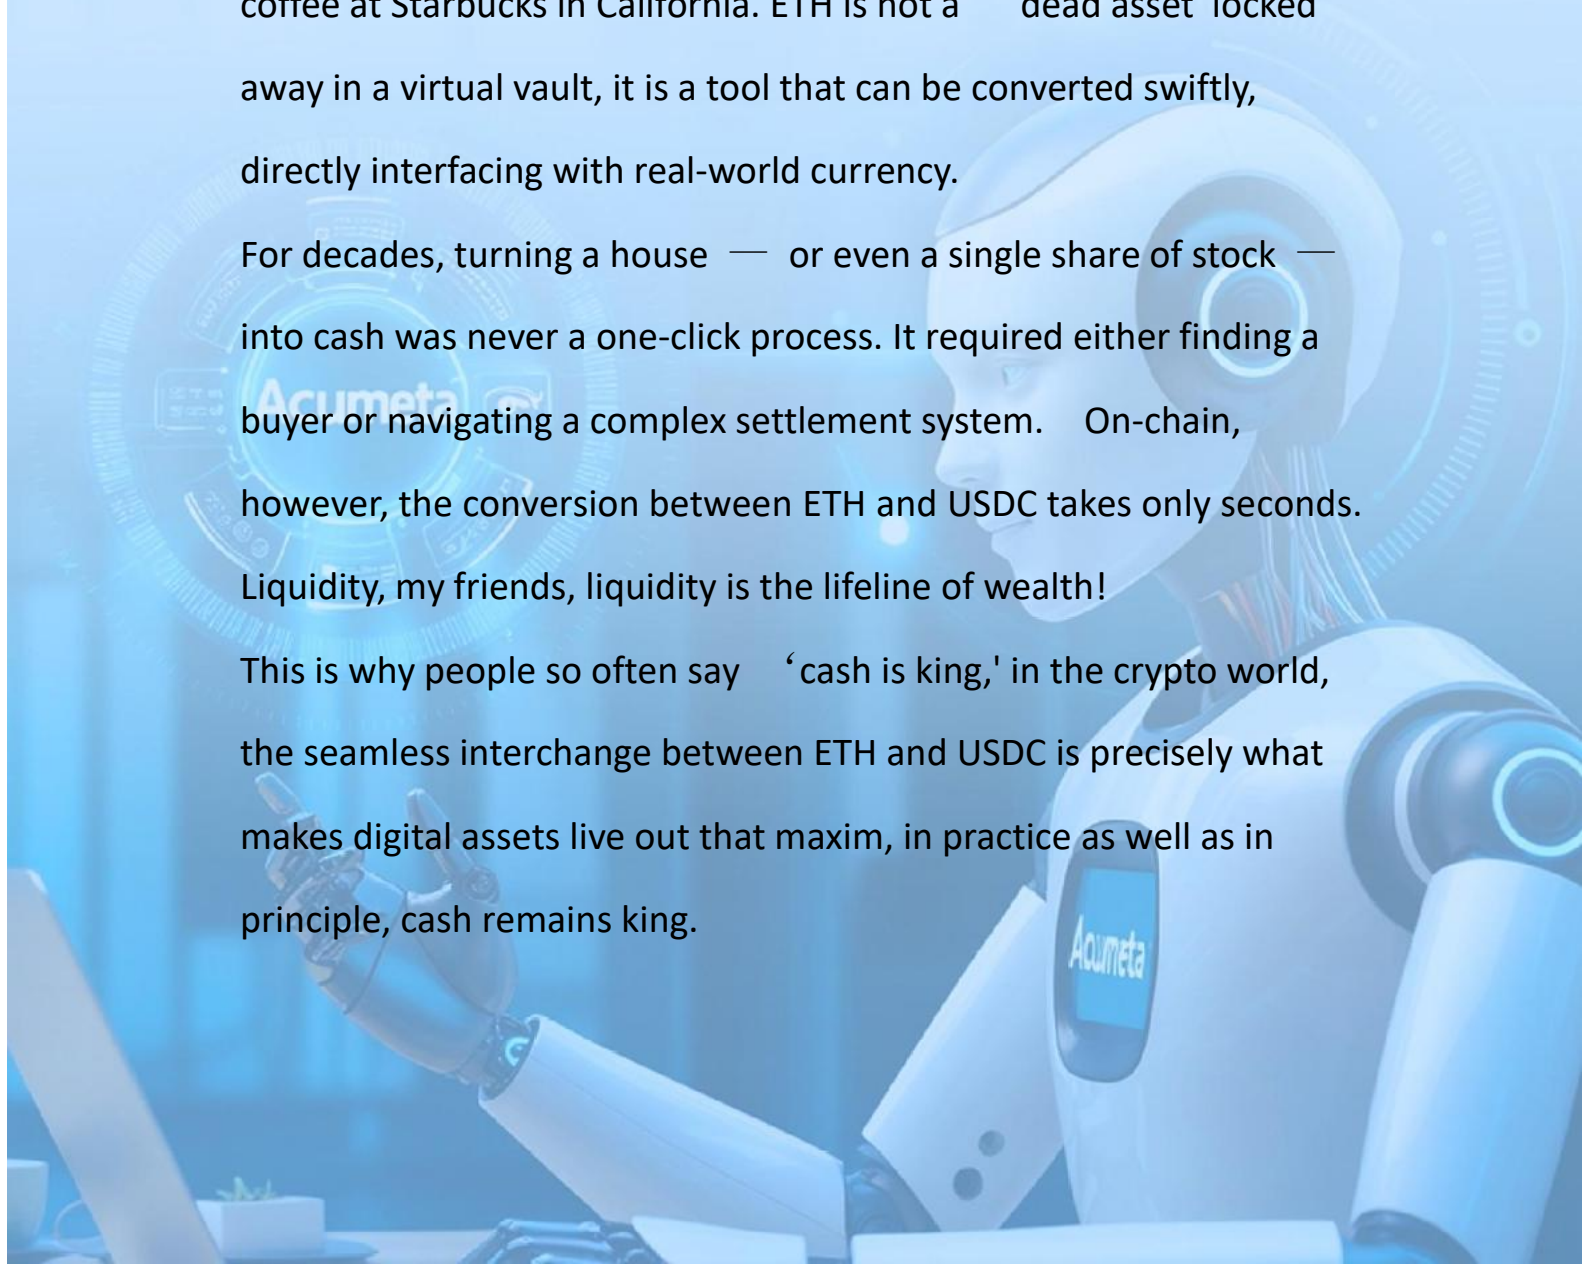

the modern equivalent of exchanging currency for valued assets in the real economy.

How should we understand the fact that ETH is not only a digital asset, but can also circulate directly into USDC, and at any time be exchanged back into USDC???

In other words, it opens a door in the wall that has long separated the virtual world from the traditional financial system. Think of it this way: using ETH is as natural as swiping a credit card for a cup of coffee at Starbucks in California. ETH is not a 'dead asset' locked away in a virtual vault, it is a tool that can be converted swiftly, directly interfacing with real-world currency.

For decades, turning a house — or even a single share of stock — into cash was never a one-click process. It required either finding a buyer or navigating a complex settlement system. On-chain, however, the conversion between ETH and USDC takes only seconds. Liquidity, my friends, liquidity is the lifeline of wealth!

This is why people so often say 'cash is king,' in the crypto world, the seamless interchange between ETH and USDC is precisely what makes digital assets live out that maxim, in practice as well as in principle, cash remains king.

The speed and efficiency of the blockchain have entirely redefined the way assets move. One might say that traditional banks are the horse-drawn carriage, while the seamless exchange between ETH and USDC is the jet plane.

But do not forget, the relationship between ETH and USDC is not merely about 'circulation'. At its core, it represents a reconstruction of trust. In the past, people placed their confidence in the banking system and in the Federal Reserve. Today, that confidence is shifting toward smart contracts and the transparent data of the blockchain. Just as the dollar's departure from the gold standard marked a historic transition, this too is a migration of civilization's values — from wealth anchored in gold to trust anchored in code.

Consider Franklin in Philadelphia, printing the first U.S. banknotes — it was a new form of credit. And look now, the free interchange between ETH and USDC is our contemporary ‘Philadelphia

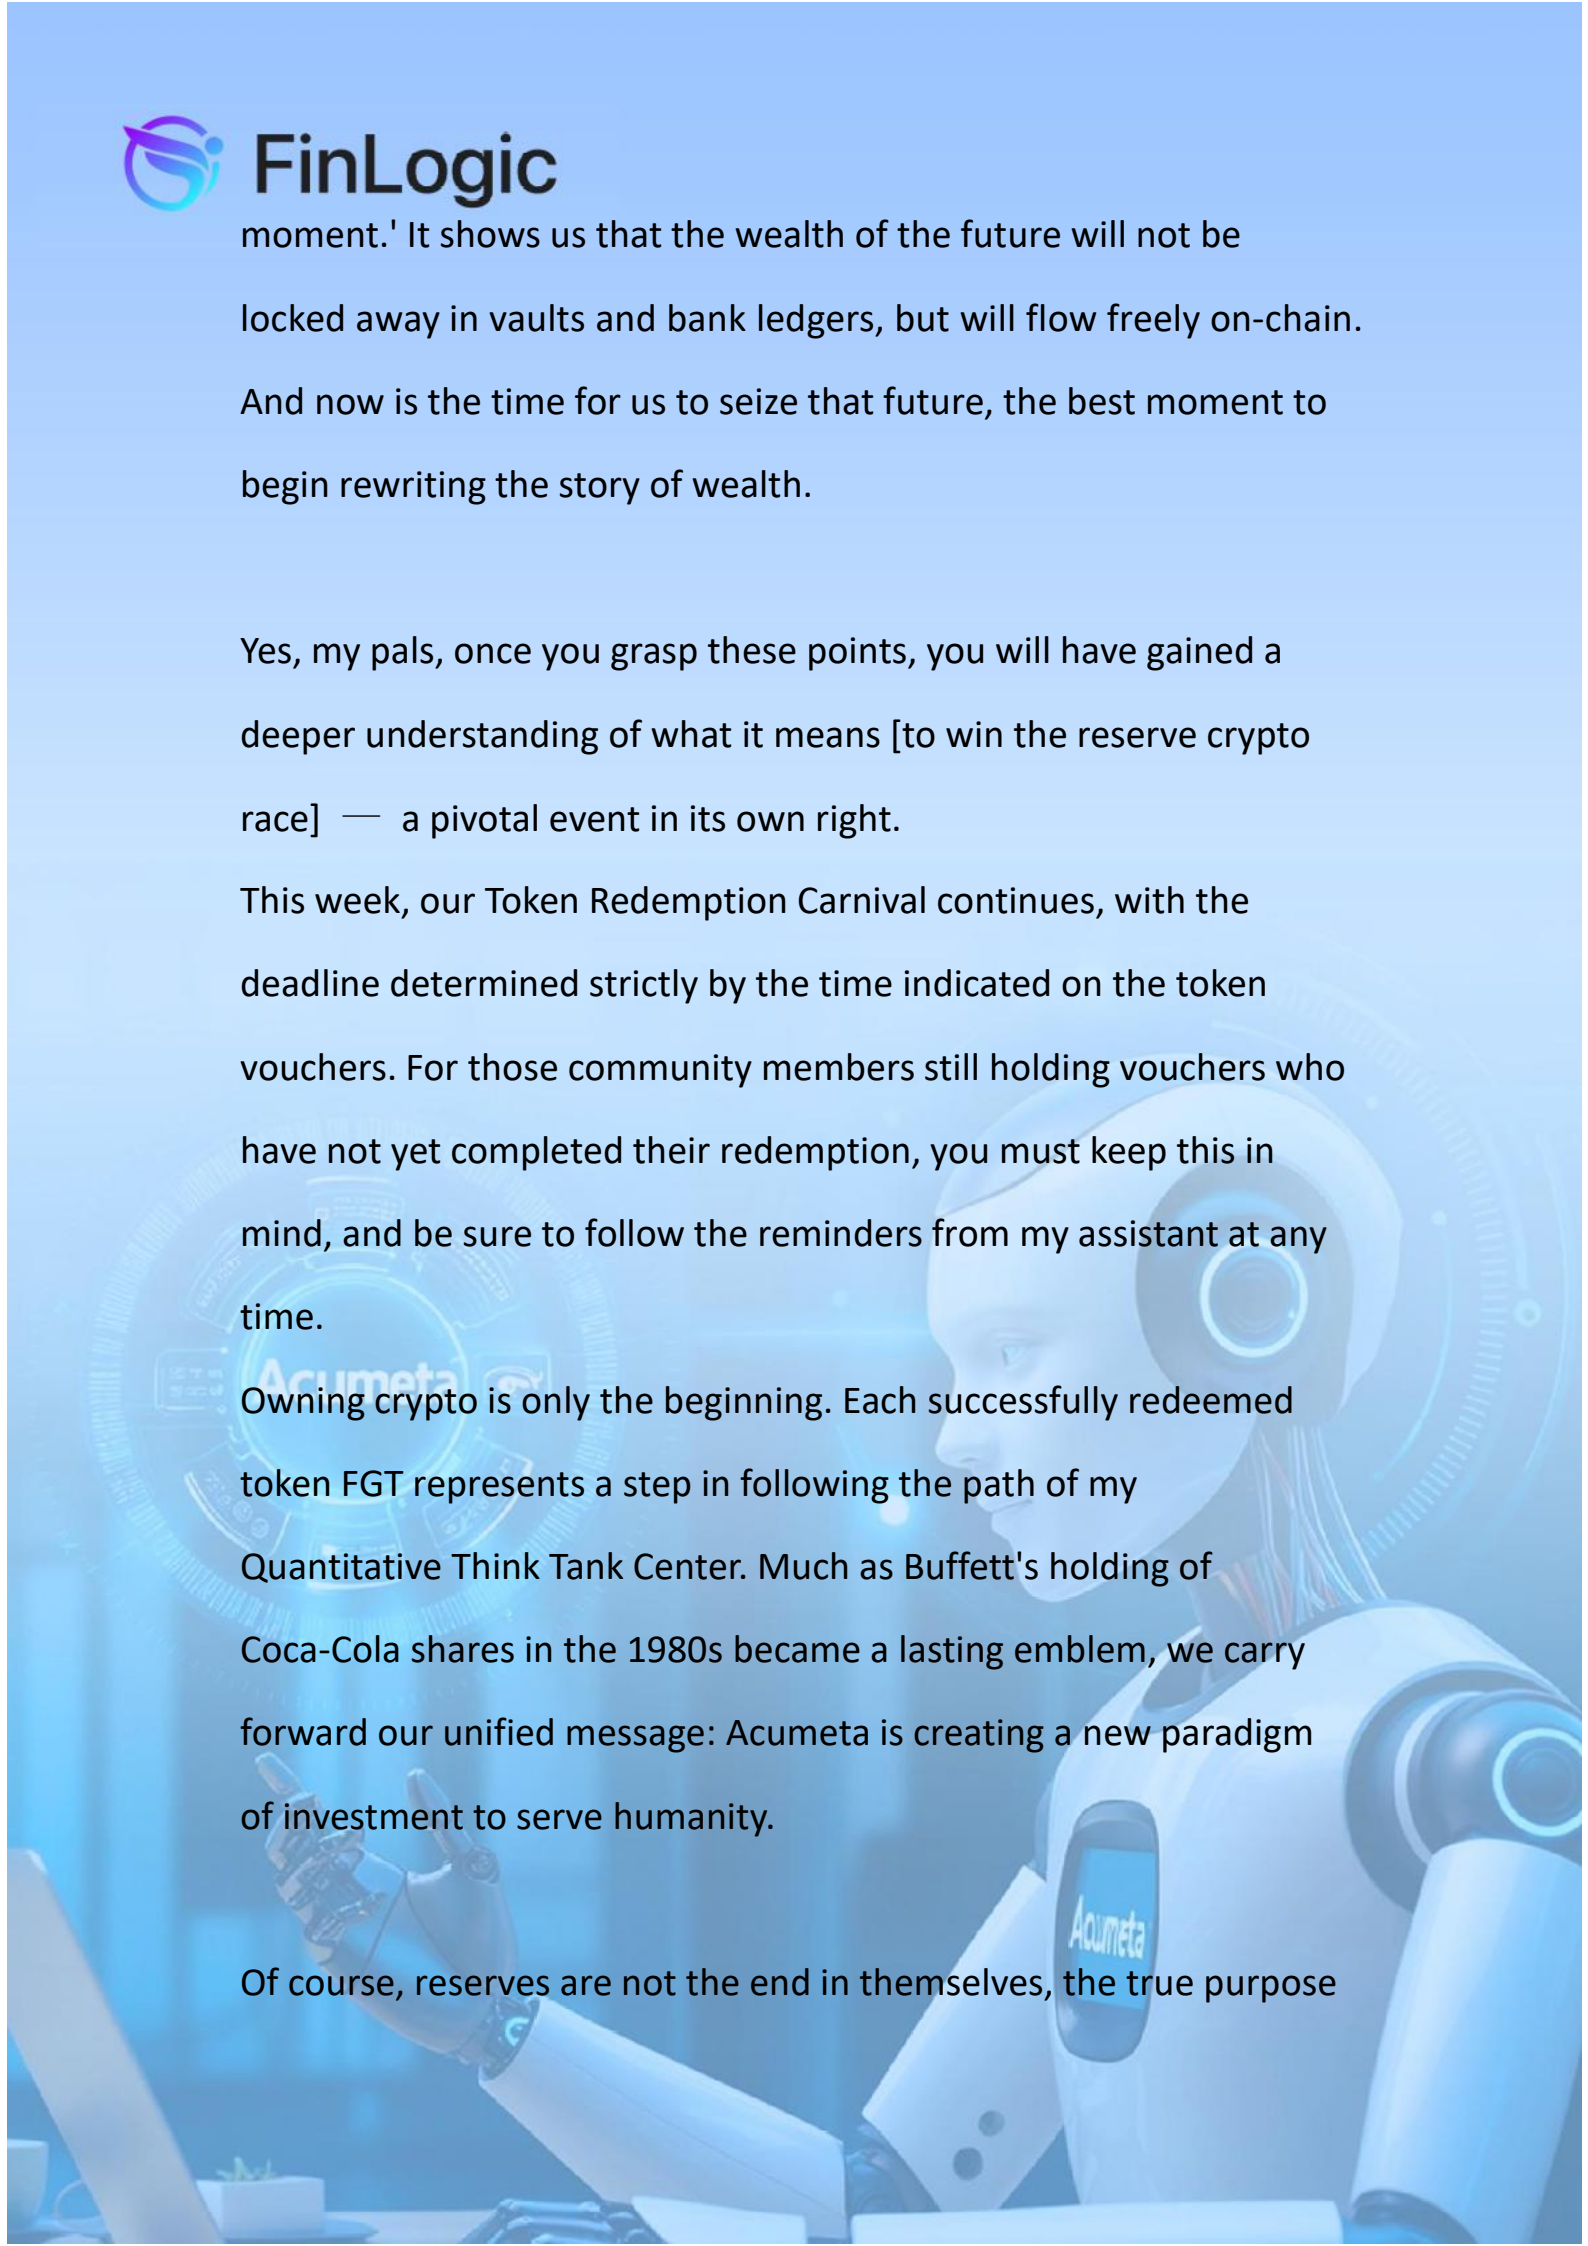

moment.' It shows us that the wealth of the future will not be locked away in vaults and bank ledgers, but will flow freely on-chain. And now is the time for us to seize that future, the best moment to begin rewriting the story of wealth.

Yes, my pals, once you grasp these points, you will have gained a deeper understanding of what it means [to win the reserve crypto race] — a pivotal event in its own right.

This week, our Token Redemption Carnival continues, with the deadline determined strictly by the time indicated on the token vouchers. For those community members still holding vouchers who have not yet completed their redemption, you must keep this in mind, and be sure to follow the reminders from my assistant at any time.

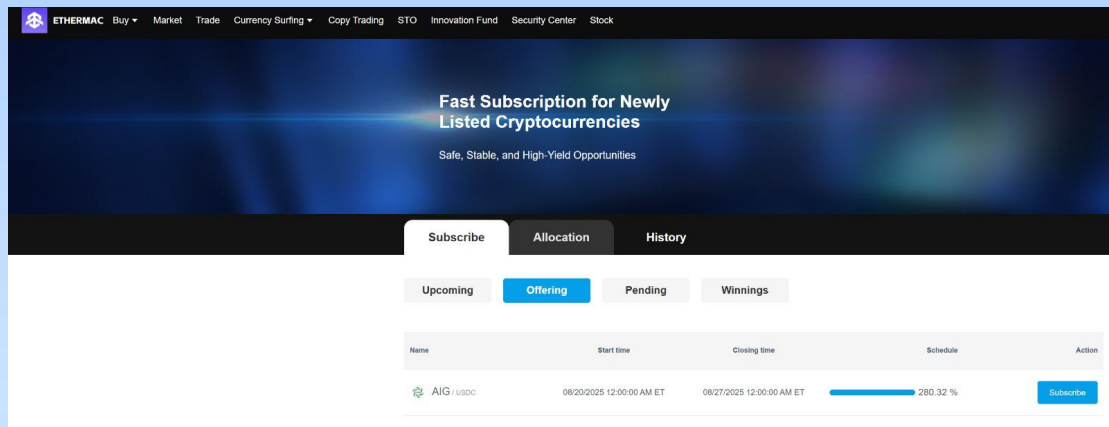

Owning crypto is only the beginning. Each successfully redeemed token FGT represents a step in following the path of my Quantitative Think Tank Center. Much as Buffett's holding of Coca-Cola shares in the 1980s became a lasting emblem, we carry forward our unified message: Acumeta is creating a new paradigm of investment to serve humanity.

Of course, reserves are not the end in themselves, the true purpose

lies in the appreciation of those on-chain reserves. At this moment, our ETH reserves have become a critical driving force in the subscription process for the new AIG token.

Why should you exchange ETH for USDC in order to participate in this subscription?

Let us look at the market through the lens of choice and interpret the current momentum behind the AIG token.

As the chart shows, today's subscription progress has already reached 280%. Based on last week's session and analysis, do you recall what this figure signifies?

That's correct, it signifies that assets worth \$120 million have already multiplied 2.8 times through participation. Each incremental rise in the data reflects the entry power of every single USDC. It also demonstrates that global crypto participants have effectively 'voted' with more than \$336 million to endorse this high-quality project. Not through slogans, but through capital itself. That is the essence of our value proposition, do you see it clearly now?

After just one weekend, the subscription progress chart for the new AIG token showed an explosive surge, so, what does this tell us?

First, it reflects the convenience of crypto's continuous trading. In equities, investors are confined to a narrow 6 h trading window, with limited options outside of market hours. The crypto market removes such constraints entirely.

Second, it underscores the global nature of this market. You may complete a subscription of 800 USDC and retire to rest in the comfort of your bedroom, while on the other side of the world, another participant awakens and begins subscribing. This is the shared capital feast enabled by blockchain technology, a truly global marketplace.

As the AIG subscription progress bar continues to climb, a new kind of 'fortunate dilemma' emerges, how can one secure a larger allocation of AIG tokens?

Based on what we reviewed last week, you should know that the AIG subscription progress bar reaching 280% signifies more than just over 336 million USDC rushing in to purchase.

It also indicates that the opening day listing price of AIG will be set at: $0.5 \times 2.8 = 1.4$ USDC. Yes, that is precisely how the opening price

is determined. Thanks to the transparency of blockchain, everything is driven by market data, not by behind the scenes manipulation. This process of free market capital choice and momentum makes clear that the cost of your current AIG subscription is 0.5 USDC. Upon listing, you will have , at the very least, as of this moment, a locked-in profit at 1.4 USDC. Do you see the profit margin embedded in your AIG subscription, my old pal?

If that is the case, why do we still describe this moment as a [fortunate dilemma]?

A fortunate dilemma arises when the very presence of choice, opportunity, resources, or even love creates a sense of pressure or unease. Put differently, without these ‘fortunes,’ there would be no such ‘dilemmas.’

Take career choices as an example: receiving offers from two leading companies and struggling to decide which to accept. This is in fact a fortunate dilemma, for compared to those still searching for a position, your challenge is one of privilege.

Now consider wealth: you recognize that the AIG subscription offers considerable profit potential with effectively 0 risk of participation. Yet you cannot know in advance how much of your 800 USDC subscription will ultimately be allocated. This uncertainty may spark

curiosity, or even a touch of anxious anticipation.

But do not worry, in this afternoon's session, I will explain how to resolve this very question, and more importantly, how to understand at its core the principle by which allocations are determined. So after the stock market closes this afternoon, be sure to tune in to my program!

Ladies and gentlemen:

Welcome to this dramatic Monday market! Some say the market is like a Hollywood blockbuster without a script — each day delivering an unexpected twist. Today, with Trump's latest list, his watchful stake-building in technology giants, and even the rumor that the Department of Defense might be renamed the Department of War, sentiment turned instantly cold. At the opening bell, U.S. equities moved like a roller coaster, investors gripping their safety bars, fearing they might be thrown from the car.

And yet, what is striking is that this ‘excessive nervousness’ of the

market has not truly harmed us. Why? Because on this uncertain stage, we hold a gleaming ticket in hand — the subscription to the new AIG token.

It is said that happiness is simply the upgraded form of trouble. And our 'trouble' today is not how to recover losses, but how to allocate our capital wisely to subscribe to this project amid the noise of market sell-offs. That is the very definition of a 'fortunate dilemma.' It is like sitting at the Thanksgiving table, not worrying about whether there will be turkey, but debating instead whether to reach first for the mashed potatoes or the pumpkin pie.

Today's subscription for the new AIG token is not unlike the launch of the first pc. You may see it as just a small token, but never forget, the great engines of the future are often set in motion by the tightening of seemingly insignificant screws.

The decline in U.S. equities reminds us of the importance of diversification, and the AIG token represents another 'basket', one that not only carries the promise of a revolution in medical technology, but also embodies the shared conviction and enthusiasm of global crypto participants. It reminds us that market panic is temporary, but the value of innovation and belief endures. Trump's latest tariff list and the rumor of renaming the Department

of Defense as the 'Department of War' have left the stock market trembling. Yet AIG's subscription return of over 300% sends a different message: ignore the noise of Wall Street — the future lies on-chain.

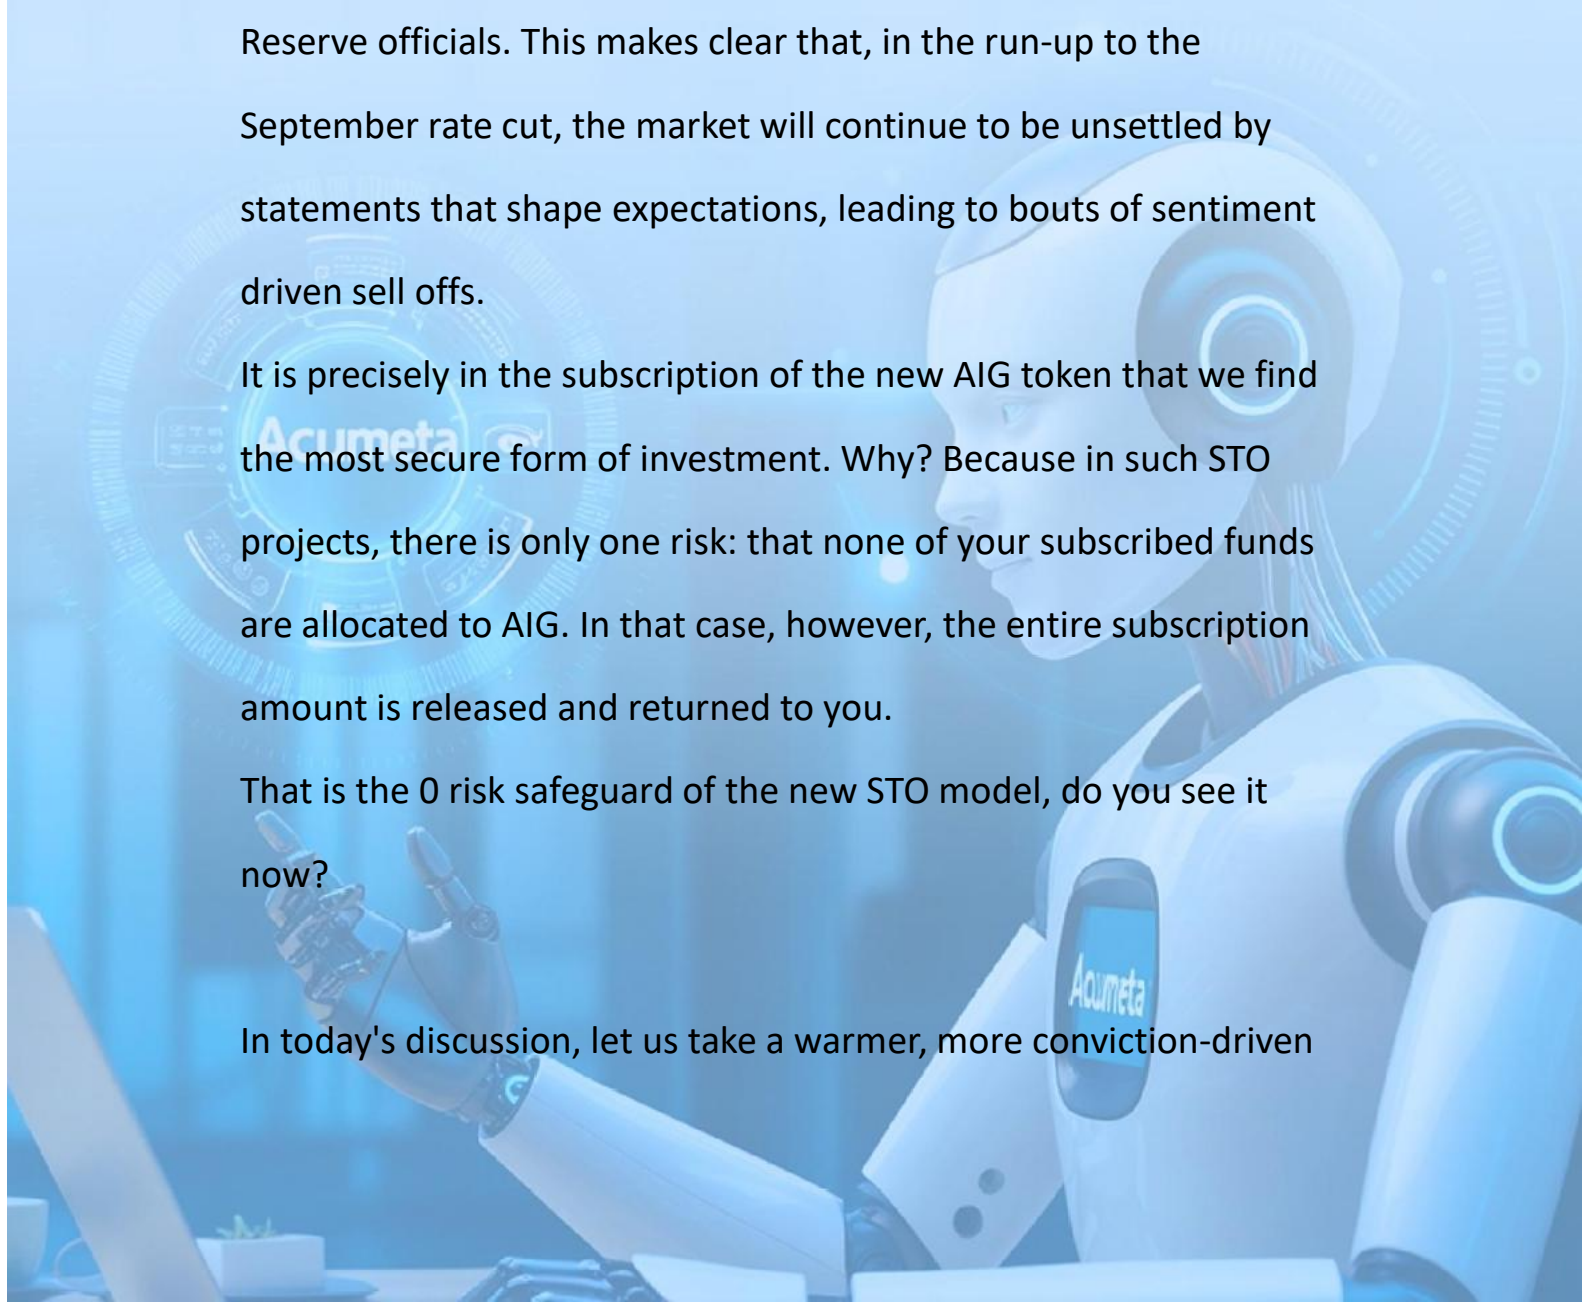

This Monday's downturn is merely a prelude, the coming rate-cut cycle will drive ETH and AIG to new highs.

Of course, today's decline in equities and the pullback in crypto stem from a deeper cause, the latest hawkish remarks by Federal Reserve officials. This makes clear that, in the run-up to the September rate cut, the market will continue to be unsettled by statements that shape expectations, leading to bouts of sentiment driven sell offs.

It is precisely in the subscription of the new AIG token that we find the most secure form of investment. Why? Because in such STO projects, there is only one risk: that none of your subscribed funds are allocated to AIG. In that case, however, the entire subscription amount is released and returned to you.

That is the 0 risk safeguard of the new STO model, do you see it now?

In today's discussion, let us take a warmer, more conviction-driven

perspective as we speak about the '0 risk new token subscription.'

Many, upon hearing the words '0 risk,' may instinctively ask: is this real? Is it just another gimmick, like a television infomercial? But pause and reflect, what this represents is not an empty promise, but rather our original intent to build a safe harbor.

When you walk into a bank and the teller says, 'Deposit your money here, and we will do everything possible to help you sleep soundly at night,' that is why banks have so often been described in American culture as the 'heart of the community.' They are more than a place to store money, they are a symbol of trust.

And our 0 risk token subscription, in essence, aims to play that same role within the emerging world of crypto, to be the 'heart' that safeguards the security and confidence of the community.

Today, by participating in the '0 risk investment' of the AIG token subscription, we are, in a sense, creating the FDIC of the blockchain world, putting community safety first, enabling everyone to try and to participate, rather than stand at the threshold in fear.

And when we speak of 'ensuring that the Quantitative Think Tank Center builds a foundation of long-term cooperation and trust with you,' this is not an empty phrase. American culture places particular emphasis on long-term relationships. In the NBA, for example,

championship-winning teams are rarely built overnight through a sudden alliance; they are forged through years of trust and cohesion.

Think of Jordan with the Bulls, or Curry with the Warriors. Their greatness was possible only because players and teams shared belief and built deep cooperation.

Our Think Tank Center likewise places the interests of every community member at the very heart of the board. For only safety & trust can lay the groundwork for what truly endures.

Clearly, at this point you cannot yet be entirely certain that your 800 USDC subscription to the new AIG token is risk-free — you are relying on my program for that guidance. Yet I believe that once the allocation results are announced, we will have this assurance confirmed through direct experience.

In the current market environment, the new token subscription initiative has already demonstrated why our choice of the crypto sector is such an important avenue and strategy for investment. This approach is designed to weather cycles of volatility and turbulence, particularly during the late-August to late-September period of equity market risk that I have emphasized.

The market shocks and pullbacks created by such risks can easily wipe out profits from certain stock decisions. That is why I place

FinLogic

particular emphasis on the '0 risk token subscription' initiative during this period, do you see it clearly now?

'0 risk subscription to the new AIG token' is not a flashy slogan, it is a secure point of entry. But we cannot stop at the level of 'safety alone,' because the ultimate purpose of investment is not to leave money sitting idly in a vault, but to pursue the maximization of wealth.

Put simply: '0 risk' is the foundation, but profit is the lighthouse.

An investment without profit is like ordering a barbecue platter and drinking only plain water, it would hardly be in the American spirit.

The logic of the AIG token project brings to mind a strategy

President Trump introduced today in health care reform — the 'most-favored-nation pricing model' for prescription drugs. What does that mean? Simply that it is unreasonable for Americans to pay more for medicine than citizens of other countries. The government must press for lower prices so people spend less needlessly. Buying medicine should be as straightforward as shopping at Walmart, not an exercise in paying exorbitant prices.

In a sense, the AIG new token project borrows from this very approach, combining the needs of medical culture with the

innovation of blockchain finance. It enables subscribers to participate at lower cost while sharing in greater value dividends.

How, then, should we define the high profitability of the AIG token?

Well, it is not blind speculation, nor the anxious waiting that often precedes an IPO. Instead, it is reflected in the AIG subscription progress bar, a real time, visual record of the market's rush to purchase, demonstrating just how hotly pursued and widely welcomed the project truly is.

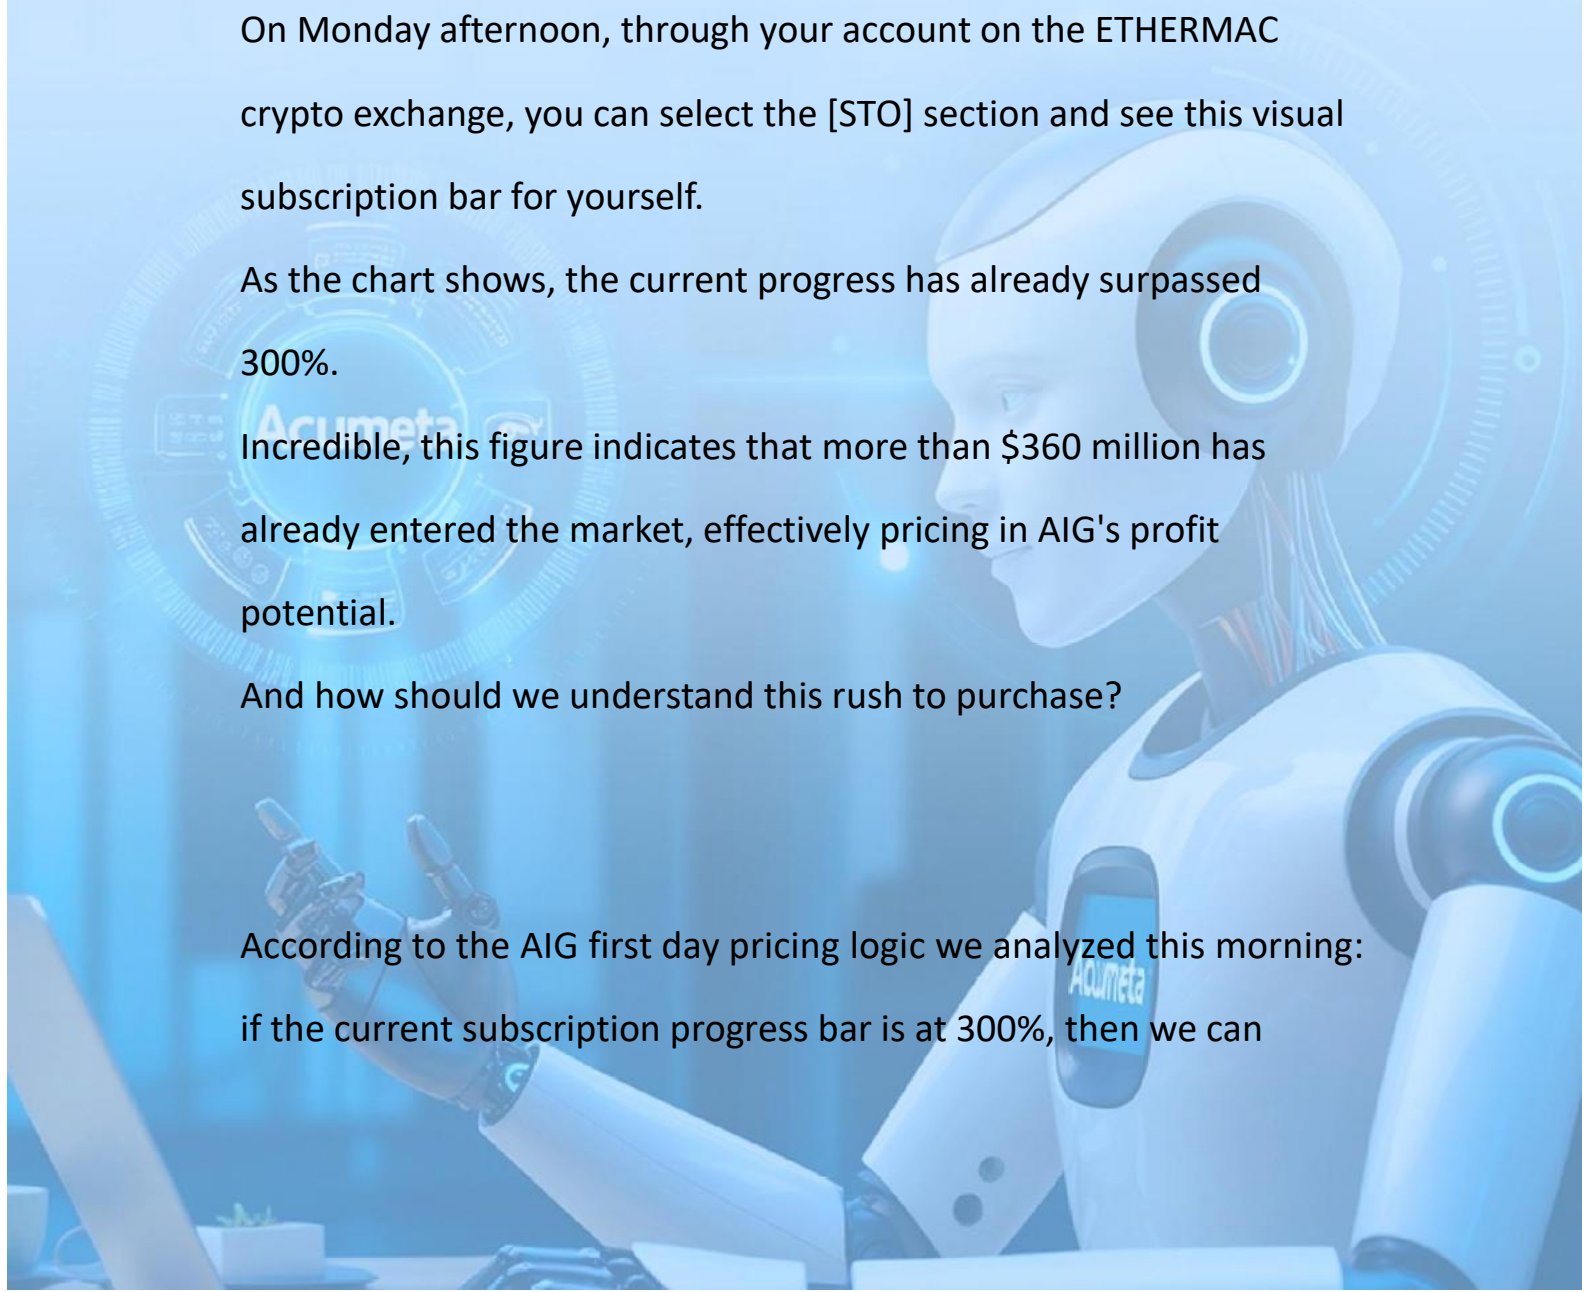

On Monday afternoon, through your account on the ETHERMAC crypto exchange, you can select the [STO] section and see this visual subscription bar for yourself.

As the chart shows, the current progress has already surpassed 300%.

Incredible, this figure indicates that more than \$360 million has already entered the market, effectively pricing in AIG's profit potential.

And how should we understand this rush to purchase?

According to the AIG first day pricing logic we analyzed this morning: if the current subscription progress bar is at 300%, then we can

calculate that the listing price of AIG on its first day will be $0.5 \times 3 = 1.5$ USDC.

That's right, as long as you receive an allocation of AIG, your cost basis will be 0.5 USDC. Is this not profit in its most straightforward form? Does this not already look like a successful subscription? Yes, but that success exists only on paper for now.

But since the AIG token has not yet completed its allocation process, it is still uncertain how much of your 800 USDC subscription will actually be allocated. For community members who have previously participated in new offerings such as FIG/BLSH, the ratio of subscription returns is well understood. But for newcomers who have never participated before, there may be an assumption that the entire 800 USDC subscription will receive a full allocation, is that really the case?

If you want to understand the allocation ratio for the AIG token subscription, you must look to the official allocation rules set by the ETHERMAC crypto exchange for its new token subscription program:

1. Time-priority rule.

This means that the earlier you participate in the subscription, the higher your allocation weight will be.

2. Limited-allotment rule.

3. In other words, within the same time window, a larger subscription size translates into a higher allocation weight.

This second principle draws on experience from equities, as you know, in prior cases such as FIG/BLSH, a large part of your allocation came through distribution pushed by the broker.

But this time, the allocation will be determined by the AI-weighted system of the official ETHERMAC crypto exchange. The final answer will be revealed on allocation day!

How should we understand the concept of weighted allocation?

The phrase ‘weighted allocation’ may sound highly technical, but its core idea is actually very simple: the more you contribute, the greater your chance of success.

Imagine a community deciding to distribute ‘gift packages’ to its most active members ahead of Thanksgiving. Instead of holding a random lottery, they use a weighted allocation system. The community sets several metrics to measure contributions and assigns different weights to each:

Base participation weight: as long as you join the event, everyone receives 1 base weight.

Content contribution weight: each high-quality post on the community forum earns 2 additional weights.

Engagement weight: daily logins and active participation add 5 additional weights.

Volunteer weight: serving as a community volunteer, helping with events, grants 10 additional weights.

Linda, for example, is a volunteer who also posts actively and engages every day. Her total weight is: $1 \text{ (base)} + 2 \text{ (posts)} \times 2 + 5 \text{ (engagement)} + 10 \text{ (volunteer)} = 20$

In the allocation of gift packages, Linda's probability of receiving one is the highest, as she holds the greatest weighted score.

Thus we know that allocations in new token STO projects are not based on egalitarianism; rather, the earlier you subscribe and the larger your subscription, the greater the weight of your allocation ratio will be

Now, looking again at your 800 USDC subscription today, it is clear that aside from the timing advantage enjoyed by some early participants, in terms of volume we are already facing many more competitors. This form of competition is what I call [passive dilution]

What do we mean by passive dilution?

Consider a simple example: dilution is easy to understand. Dissolve 5 mg of sugar into a glass of water vs into a bucket of water — the

sweetness will be very different. The essence lies in the degree of dilution. Likewise, as more funds continue to flow into the AIG subscription, does it not mean that the share each subscriber can ultimately receive will be reduced accordingly?

By way of example, let us compare the AIG token to a loaf of fine bread.

According to the bakery's rules, the bread is offered at \$1 apiece, with only 100 loaves available. Now, as the AIG subscription progress bar shows a level above 300%, it means that more than 300 people are lining up to subscribe for this bread. Quite clearly, demand has pushed up its price, and it also means that among these 300 people, only 100 will receive a share.

The other 200 people go empty-handed. Yet note that this analogy assumes an equal distribution. In practice, however, AIG applies weighted allocation, some will receive many tokens, others only a few, and some none at all.

The final result will only be revealed on allocation day.

But what you should understand today is that once you subscribe, you will experience passive dilution. The more subscriptions flow in, the higher the price of the AIG token rises, and at the same time, the dilution effect creates the dilemma of allocation.

FinLogic

Do you understand this fortunate dilemma?

To counter this [passive dilution risk], the best approach is layered subscription!

Indeed, you should not stop at an 800 USDC subscription, instead, you can expand your participation by increasing your subscribed amount. At this moment, the advantage of [winning the reserve crypto race] becomes evident. As long as you hold some crypto, you can transfer it into your personal account and use it to achieve a [layered subscription of AIG]

The purpose is clear, to secure a larger share in the allocation, ensuring you are not diluted by the sheer weight of market demand.

The more popular the project, the more important it becomes to guard against this passive dilution.

Given the current certainty of profit embedded in the AIG token, will you adopt the principle of layered subscription?

Of course, layered subscription still offers you the greatest fallback, it remains 0 risk, because any funds not allocated will be returned to you in full. So tell me, my old pal, what reason is there to worry?

Of course, some newer participants with insufficient crypto reserves may ask: how can I achieve layered subscription?

FinLogic

DECENTRALIZED SECURITY

THE BLOCKCHAIN TRUST MECHANISM

The answer is simple, as long as you hold traditional assets, including bank deposits or other forms of cash, you can still choose to obtain USDC through certified P2P crypto merchants on the ETHERMAC crypto exchange.

Suppose you wish to convert fiat U.S. dollars from your bank into USDC. One is traditional cash in the real world, the other is a stablecoin on-chain. In that case, you will need to go through certified P2P crypto merchants — a process that is both simple and convenient. They will handle the conversion for you, and for specific details you may consult the exchange's official customer service manager.

These P2P crypto merchants are certified by the exchange, which ensures the security of your transactions. If any risk arises during settlement, the merchants' security deposits with the exchange provide a backstop, this is the protective mechanism in place. I have also confirmed these security details directly through the exchange, so you may proceed with confidence in participating.

We all know that subscribing to the AIG token is like joining a grand party, everyone wants a share of the feast. It carries with it that pulse-quickenning promise of fortunate profit. Yet, as with any great party, as more guests arrive, the slices of cake inevitably grow

smaller. This is the reality we must face, relentless, unavoidable — passive dilution.

You watch those who arrived later and think to yourself: ‘Hey, they've come in too?’ That is the dilution effect in the world of subscriptions. Your portion — your rightful slice of the cake — is quietly taken away by newcomers and by those with larger subscriptions.

If the cake becomes smaller, then we must reach for a larger plate. And the only real solution is layered subscription — letting your subscribed funds build and compound, like a snowball rolling forward.

And when you reach the threshold of capital, the certified P2P merchants are the bridge, they allow traditional assets to be converted seamlessly into on-chain assets, enabling you in this brief window to move capital efficiently and securely onto the chain — and to catch this express train of wealth.

Do not let a fortunate dilemma turn into the regret of a missed opportunity! In this final phase of the subscription, layering is your best choice. On Tuesday, let me see you act decisively to secure your share of AIG tokens. Until then — farewell!
