Warriors of Rate-Cut Liberation Day:

Welcome to this pivotal moment ahead of the Federal Reserve's rate-cut decision! I'm your old friend.

Right now, the lights on Wall Street shine brighter than ever, because everyone knows that tomorrow—Wednesday—a drama will unfold that will shape the course of our future wealth.

The countdown is on, just 24 hours remain! We are all holding our breath, watching the Fed's decision. Will it be a 25 bp cut? Or 50 bp?

This question hangs over the global capital markets like a giant suspense.

These are not cold, sterile numbers, they are the true compass of wealth, the signposts that determine where trillions of dollars will flow next.

The capital markets are like a mighty river. On ordinary days, the current runs gently, but once the floodgates open, the surging torrent smashes against every embankment. Those standing in the right place can ride the current and seize the opportunity; those who hesitate risk being thrown back onto the shore by the wave.

At a moment like this, investing is not just cold, hard math—it's a psychological battle. You must have the courage to believe you are standing at the very crest of the tide.

A 50 bp cut doesn't merely "send a signal." It ignites the spark of

Why does a rate cut unleash such euphoria in crypto? The logic is simple. When U.S. interest rates fall, the value of holding cash shrinks. Money sitting in a bank account no longer feels attractive. Investors start chasing assets that can outpace the erosion of purchasing power.

And crypto stands front and center. Volatile? Absolutely. It surges fast and it falls fast. But that very volatility makes it feel like a raucous party—when capital floods in, the rhythm of the rally sends adrenaline rushing through everyone's veins. So don't think of a rate cut as just a number. Think of it as a signal of wealth redistribution. A 25 bp cut makes the market nod and say,

"Yes, the Fed is moving." But a 50 bp cut? That makes the entire world sit up straight, eyes flashing with recognition.

How to become an investor who outpaces inflation?

When the Fed cuts rates, put simply, it is lowering "the price of money." The lower the interest rate, the cheaper it becomes to borrow. Take a mortgage, for example, if rates fall, your monthly payment burden drops.

For companies, the cost of raising capital to expand becomes easier to bear. Sounds good, right?

But don't forget the side effect: when borrowing gets too easy, cash floods the system. And when there's too much money chasing too few goods, prices inevitably rise. That's inflation.

A rate cut is like giving the economy a shot of adrenaline. A small dose keeps things alert; a larger dose can make the entire market restless, even overheated.

So why, in such an environment, is crypto seen as a tool to "beat inflation"? The logic is straightforward: when the U.S. dollar keeps losing value, investors naturally look for assets that can't be diluted by money-printing. Bitcoin has become the digital-age alternative. Its supply is capped at 21 million coins, hard-coded and unchangeable. Unlike fiat currency, it can't be printed at will. In other words, it is "hard currency" —digital version of gold.

Suppose you had put \$10k in the bank during the pandemic in 2020. Today, accounting for inflation, that purchasing power has shrunk by at least 15%. A quick trip to the supermarket tells the story—milk, eggs, rent, gasoline—all cost more than they did 3 years ago. But if you had bought Bitcoin instead, even with all the volatility along the way, over the longer horizon its gains have outpaced inflation by several multiples. That's why so many high-net-worth investors allocate a portion of their assets to crypto during rate-cut cycles.

Now let's talk about the U.S. dollar's purchasing power. Did you know that since the 1970s, the dollar has lost more than 80% of its value? Once upon a time, one dollar could buy four bottles of Coca-Cola; today it barely buys one. Where does the problem lie? In the Fed's relentless flood of liquidity.

In particular, the massive rate cuts and quantitative easing of 2020 unleashed a wave of money into the market on a scale never seen before.

After the sharp rate cuts in 2020, the side effects appeared immediately—housing prices soared, the stock market surged, and the cost of goods shot higher. In those years, the cost of living for American households rose significantly, the middle class was squeezed, and for young people, buying a home became even more out of reach.

The advantage of crypto lies in the fact that it doesn't belong to any government and cannot be manipulated at will. Take Bitcoin, for example, it halves every 4 years, a design that makes it more like "armor against inflation." Because in a rate-cutting cycle, the dollar loses value, but BTC can rise against the tide, helping investors hedge away that inflationary pressure.

Let's look back at 2020. After the Fed cut rates, Bitcoin's price climbed from under \$10k to nearly \$60k! Those who had the courage to invest in BTC in 2020 saw their wealth multiply, several times over, even by an order of magnitude!

This is the wealth transfer of inflation!

When the Fed prints money, those holding cash see their wealth

diluted. But those holding BTC see their wealth grow exponentially!

And now, with the Fed's rate-cut decision about to be revealed, we stand at a historic moment. What we must do is break out of old ways of thinking, embrace new assets, and seize new trends!

Remember: in the face of inflation, cash is the most dangerous asset!

And remember this: BTC is the "digital gold" of our era! Together, let's use crypto to outpace inflation—and achieve true financial freedom!

We've already talked about the opportunities that rate cuts might bring, but we also need to clearly recognize the truth behind them.

Why does the Fed cut rates? This question is what separates the "rookies" from the veterans.

There are generally 2 scenarios for Fed rate cuts:

First: Preventive rate cuts.

This is like a doctor giving a perfectly healthy patient a "booster shot." The economy is running smoothly, but the Fed anticipates potential risks ahead. To prevent overheating or slowdown, it makes adjustments in advance. In this case, a rate cut injects new energy into the markets—and the stock market celebrates.

Second: Recession-driven rate cuts.

This is like a doctor trying to "resuscitate" a patient already in critical condition. The economy is showing signs of recession, rising unemployment, falling corporate profits, and the Fed is forced to cut rates to stimulate recovery. In this case, the cut acts more like a "sedative," and the stock market enters the "ICU"

Think back to 2020, during the pandemic. That round of Fed cuts was more like an emergency rescue. The economy came to a standstill overnight, and the Fed unleashed unprecedented rate cuts along with quantitative easing. While stocks did rebound in the short term, it was a "false prosperity" built on massive inflationary pressures and soaring unemployment risks.

Tomorrow's rate cut, my friends, is not a preventive one—it's a textbook recessionary cut.

Why? Because the recent data speaks for itself: the job market is clearly under pressure. Many companies are scaling back hiring, unemployment claims are climbing, and everyday people are finding it harder to land jobs. At the same time, corporate cash flows are tightening. A rate cut in this context is, quite frankly, the Fed admitting: we have to put out the fire.

And that means tougher times ahead. Don't forget, the stock market's logic is built on earnings expectations. If corporate profits are declining, then no matter how cheap borrowing becomes, investors won't buy in. Many people fantasize that a rate cut will instantly drive stocks higher, but in a recessionary environment, cuts can usually only provide a floor—never spark a full-blown bull market.

The onset of the pandemic in 2020 offers a telling illustration. Confronted with crisis, the Fed moved with unprecedented speed—slashing rates to 0 and even embarked on unlimited quantitative easing, yet the stock market still plunged sharply in a short span of time.

Why? Because the labor market was frozen, consumer spending collapsed, and corporate profits had no support. Rate cuts can

rescue liquidity, but they cannot revive demand once it has been drained.

That is why I urge you to lock in your stock profits, reduce your equity holdings, and move into cash, this is your best strategy!

At this moment, charging headlong into stocks is much like the following story:

A fisherman, seeing a storm brewing on the horizon, hurriedly casts his net, hoping to catch a few more fish before the waves hit. But when the storm arrives, the school scatters; the fisherman hauls up an empty net and nearly gets swallowed by the surging sea. This is the predicament of the stock market under recession-driven rate cuts—you think you can scoop up bargains, but when the broader environment turns against you, you may end up with nothing but empty hands.

So where, in such a climate, does true opportunity lie? My answer is clear: crypto is the place of refuge.

The question is how, during a rate-cutting cycle, one can use a strategy of "currency surfing" to ride wealth to the crest of the wave.

Currency surfing is designed precisely to capitalize on volatility—it is not dependent solely on a rising market. Its essence lies in seizing

opportunities in both bullish and bearish directions, capturing short-term, high-efficiency gains.

And now is precisely such a moment. On Tuesday, the potential profit target stood at 430%.

That means while others are still hesitating on the sidelines, you could already be realizing returns that double and redouble. The logic behind it is the combination punch of "rate cuts + volatility + surfing"

The pricing of the Fed's recession-driven rate cuts is already taking effect, and within this extraordinary cycle, the currency surfing strategy is entering its rightful moment in the spotlight!

Many in the market remain hesitant: is a rate cut truly an opportunity, or merely a trap?

Yet the real winners are never those who only skim the headlines, but those who can grasp the trend and dare to dance on the crest of the wave.

What does a recessionary rate cut signify? It signals that the U.S. economy has already shown signs of weakness, most notably, strains in the labor market are now widely recognized. In other words, the Fed's actions at this moment are not a matter of "proactive prevention," but rather a case of "reluctant damage

At such times, the stock market often enters a difficult investment phase—corporate earnings decline, liquidity dries up, and valuation bubbles begin to burst one by one.

Crypto are different! They are like a speedboat in a storm, able to cut through the waves head-on, and also harness the swells to accelerate. The currency surfing strategy frees us from the limits of one-directional markets, whether rising or falling, by allowing flexible shifts between long and short positions, capturing explosive bursts of volatility in the short term.

When a recessionary rate cut is being priced in, the window for currency surfing opens. Large funds and heavy positions often harvest their richest returns during these "intensive profit peak periods."

Remember the dramatic rate cuts of 2020? In its bid to rescue the markets, the Fed slashed rates straight to 0. And what happened? Stocks plunged at first, then clawed their way back only with the aid of unlimited quantitative easing. Meanwhile, BTC and other major crypto soared at an unprecedented pace—leaping from a few thousand dollars to tens of thousands. Some saw their wealth multiply many times over in that wave, while others, paralyzed by

hesitation, missed the opportunity. The real difference was not the news itself, but the action taken!

And now, once again, history's stage is set before us. A recessionary rate cut is bound to squeeze the dollar's purchasing power and bring new inflationary risks. When the dollar is flooded into the market, it means paper money becomes increasingly "worthless"; the cash sitting in your bank account will buy less and less. At such a moment, the only assets that can withstand devaluation, and even outpace inflation, are scarce assets and high-volatility instruments. At the very core of these stands crypto.

Imagine, starting tomorrow, with the Fed's rate-cut decision as the turning point, we ride the waves—surfing through the flood of inflation, witnessing the "winter" of the stock market, finally reaching the "ground of redemption" where financial freedom becomes possible—crypto!

Pals,

Some of you may still be hesitating. You may be thinking: "This all sounds promising, but how do I move my money from the bank into the world of crypto?"

In the traditional financial world, your money does not fully belong to you.

Your money sits in a bank account. To withdraw it, you need the bank's approval; to transfer it, you need the bank's verification.

Every transaction is monitored by someone else.

It is like living in a "cage"—it may appear safe, but you will never truly be free.

Crypto, however, offers us a chance to break free of that "cage"!

Once your money enters the world of crypto, you become the sole master of your wealth.

You no longer need a bank's approval, nor anyone else's validation.

Your money sits in your own wallet, at your command, anytime, anywhere. This is the philosophy of individual financial liberty.

That is why we need P2P-certified merchants to help us.

Together, with conviction and courage, let's move your traditional assets and cash onto the chain through P2P-certified merchants.

Don't let your future self regret today's hesitation.

This afternoon, we'll continue to seek out Tuesday's exhilarating currency surfing opportunities—striving for even greater gains.

Until then!

Pals, witnesses to this historic moment on the eve of the Fed's rate cut:

Today's topic is not just another item of financial news—it is a wave

that will shape the direction of future wealth. Mark this moment in time: Tuesday, when BTC stood as the only asset on the market to rise. While other traditional assets were still struggling, mired in the mud, BTC surged ahead with confidence, signaling to everyone that the turning point had arrived. Why? Because within the next 24 hours, the Fed will carry out a historic recessionary rate cut, and we stand at the very juncture of wealth transfer, becoming the favored beneficiaries of this new era.

This means the market is sending you the clearest of messages: the story of traditional assets is drawing to a close, and the lights are already rising on a new stage. BTC is the lead actor, and currency surfing is the surfboard that allows us to ride the wave. In financial markets, timing is everything. Bitcoin's rise today is the signal of a great swell forming—and the currency surfing strategy is what enables us to dance upon the crest of the wave, rather than stand

stock.moreStockTokenizationFeaturesWillBeOpenedLater

The logic of recessionary rate cuts is already clear. The Fed is not acting to "add icing on the cake," but rather to "put out fires." With pressure mounting in the labor market and economic momentum weakening, it has no choice but to press the "soft-landing button" Yet it is important to understand: the outcome of recessionary rate cuts is often difficulty for stock market investors. Why? Because when corporate profits decline and valuations lose support, no amount of rate cuts can create genuine growth, they merely delay the downturn. In other words, the stock market is more likely to deliver disappointment.

Crypto, however, is different! Built on the logic of decentralization, it does not rely on corporate earnings or annual reports, but on the flows of global capital and collective conviction. In a cycle of rate cuts, as the dollar's purchasing power is diluted, capital inevitably seeks a new safe haven—and Bitcoin is the most natural vessel.

Do not underestimate today's signal. Bitcoin has emerged as the only rising asset class, and this is no accident, it is the market ringing the bell! It is telling us that wealth is spilling out of old vessels and gathering in new channels. And we happen to possess the tool of currency surfing—a strategy that allows us to capture volatility amid turbulence and amplify returns on the crest of the wave. This is not a theoretical possibility, it is an opportunity visible here and now!

I still remember the scene in 2020. At that time, the Fed also resorted to emergency rate cuts, and the stock market briefly collapsed. But Bitcoin?

It soared from just a few thousand dollars to over 60k. How many people reversed their fortunes in that wave? Some went from ordinary office workers to multimillionaires; others rose from small investors to fund managers. The only difference was whether they had the courage then to jump onto that surfboard.

Today's situation bears a striking resemblance to those days! The difference is that we now have more sophisticated tool—currency surfing. Unlike back then, when one could only "hold long positions and hope," this strategy allows us to switch flexibly between long and short, profiting from every breath the market takes. This

moment is not only a turning point for the markets, but also a watershed for personal wealth. Will you continue to cling to traditional assets, watching them struggle in the mire of recession? Or will you decisively pivot—embracing Bitcoin and currency surfing to meet a new peak?

History has never favored those who stand by and watch, it rewards only those with the courage to act in advance. Today, BTC has already given us the signal, the Fed's recessionary rate cut is merely the background music, while currency surfing is the microphone that lets us step onto the stage.

Do not hesitate, do not delay—for the wave has already risen, and the future is calling. Today's wave will not wait for tomorrow's you; but today's you can become tomorrow's winner. This is the true essence of wealth, and it is our greatest opportunity at this moment!

What is a "recessionary rate cut"? It is like a beautiful piece of candy—bright and shiny on the outside, but poisoned within.

Ordinarily, a Fed rate cut is considered good news. It stimulates the economy and lifts the stock market. But when the reason for the cut is the threat of recession, it becomes a piece of "poison pill."

When the Fed cuts rates, we cannot look only at the "good news";

we must also see the "bad news" that lies behind it. When the stock market declines cautiously, what we must do is not panic, not complain, but take profits!

Taking profits is not giving up—it is the art of protecting gains!

So how should we pivot to new investment fields? Why should we make the shift into crypto field?

Since opportunities in stocks are shrinking while risks are rising, it makes sense to reduce some equity holdings and lock in profits. By comparison, the opportunities in crypto are clearly greater. At the same time, through Acumeta we have validated trading outcomes, proving that—whether in trade timing or across trading cycles—we possess excellent initiative. In crypto contract trading, we have uncovered a new kind of wealth code: earning spreads from short-term price fluctuations in contracts, and executing trades with reliable signals provided by Acumeta, this method is without doubt a first-class opportunity. Pals, with this new trading approach—short-term, efficient, and reliable—have you decided to seize it? Or will you let this round of new wealth rewards pass you by?

Make yourself the big winner!

Pals, we are not bystanders—we are the protagonists, the very

focus of the arena. You cannot test for the sake of testing, or verify for the sake of verifying, you need to seize the greatest wealth opportunity this era has to offer. Therefore, you must initiate new measures for on-chain assets. First, if you currently hold on-chain assets, such as BTC, ETH, USDT/USDC, or other crypto, you can top up your account to provide the initial funds for currency surfing trades. Second, you can prepare to make exchanges, allowing your traditional assets to find the optimal conversion path. This is where the P2P merchants of ETHERMAC crypto trading center come in, their very purpose is to ensure you can obtain on-chain assets quickly, safely, and conveniently, all you need is U.S. dollars to make it happen.

So, what kind of organization are P2P exchange merchants, really? Many members may be wondering where the P2P-certified settlement merchants on the ETHERMAC crypto trading center come from, and what their role is.

Let me give a simple example. As an American, if you have ever traveled abroad—whether to Europe, Asia, or Australia—once you arrive in a new country, you may have found yourself in urgent need of exchanging the U.S. dollars in your hand, or in your bank, at a designated currency exchange counter at the airport to obtain the

local currency. This is something we often encounter when traveling.

Today, however, we are not traveling—we are simply entering the crypto market. What we need are on-chain assets, namely stablecoins such as USDT/USDC. And it is precisely the P2P settlement merchants who can help us meet these needs.

As for the ETHERMAC crypto trading center—being a trading center subject to strict MSB regulation—it operates in accordance with the established rules governing digital currency exchange. All P2P settlement merchants admitted to this trading center come from around the world, because blockchain technology itself is inherently global and built upon a decentralized trust mechanism. To safeguard all users' funds, the trading center requires every P2P settlement merchant to post a security deposit. The purpose is to ensure that when you complete a settlement through official customer service, the trading center guarantees your funds will be credited in full, with no risk of credibility issues—because P2P settlement merchants are subject to the relevant oversight and restrictions. Therefore, from today, if you require an exchange via P2P merchants, please reach out to the official customer service staff to assist you in carrying out these operations. If your on-chain

assets are substantial, then begin right away, continue to leverage their advantages and expand their scale. The transformation of on-chain assets is fast becoming the foundation of a new system for tomorrow's true winners.

The market is random, and our trading behavior is also randomized! Of course, we have a more reliable tool—and that is the demonstrated practical value of Acumeta! Many members of the big winner plan are likely already making intensive preparations for their trading funds. Well, your initial trading capital may come from BTC, ETH, or other crypto. All of these can be converted into the stablecoin USDC. You can also use traditional methods such as bank wire transfers, and complete the exchange through P2P trusted settlement merchants. In short, all on-chain assets and your traditional assets can be exchanged with one another. And if you want to become a big winner, this is the path you must take, and it is your best choice.

When the stock tokenization process of ETHERMAC trading center echoes the application for stock tokenization on Nasdaq, this is no mere coincidence—it is a signal, a sign that the future has already begun to quietly open before us! U.S.-compliant crypto services are

becoming the main thoroughfare for global wealth transfer and capital flows, and we now stand at the very starting point of this road. In financial history, every time a framework of compliance and regulation has been built, it has given rise to a new generation of "capital winners." From the earliest banking systems, to the emergence of securities trading centers, and now to today's crypto assets—the winners have never been those who hesitate, but those willing to commit when the winds shift—and who grasp the rules of the game.

What is the core significance of tokenization? It enables stocks, as traditional assets, to circulate on-chain. In other words, it transforms a "limited market" into an "unlimited market." It is as if you once could only buy groceries at the local farmers' market, but now, through Amazon, you can purchase goods from all over the world. Stock tokenization is the amplification of capital liquidity and investor freedom without limit.

Choosing a trading center with an MSB license and a robust security architecture is not merely choosing a trading channel—it is choosing a vault for your wealth. The security center of ETHERMAC trading center functions like a defense system: protecting your assets from hackers, shielding your trades from fraud, and

safeguarding your identity from exposure. This is the true shield of financial freedom.

Compliance. ETHERMAC trading center is actively working with U.S. regulators and striving to obtain the relevant *MSB* licensing for currency regulation. For a trading center, this is absolutely vital—it is like a protective *"talisman."* With it, we can be confident that this trading center is legitimate and secure. We can entrust our assets to this trading center with confidence.

Technology. ETHERMAC trading center employs the most advanced encryption technologies and the most powerful security systems. It is like an indestructible "fortress", able to withstand any hacker's attack.

And transparency. ETHERMAC trading center regularly publishes its audit reports and makes its reserves public. It is like a transparent "glass house", where anyone can see everything inside at any time.

Our "currency surfing" day has once again reached its climax! On Tuesday, we witnessed the frenzy of the market together, and we created new miracles together! Many are rejoicing over their results on Tuesday. Some won 200%, some 300%, and a few even surpassed 430%! When I see these numbers, I feel immense pride! This is not only your victory, but also a triumph of our wisdom and

courage! Top up with confidence, and trade with peace of mind through currency surfing! We have the most professional team, the most precise strategies, and the most comprehensive information.

THE GREAT WEALTH WAVE OF RATE -CUT LIBERATION DAY					
PERFORMANCE LEADERBOARD					
DATE	ACUMETA PROJECTED RETURN RATE	TRADE TYPE		REALIZED RETURN RATE	TOTAL SIGNALS
		CURRENCY SURFING	QUICK OPTIONS		
Monday	260%	2 times	2 times	276%	2 times
Tuesday	430%	2 times	2 times	380%	2 times
Wednesday	710%				
Thursday	530%

We have Acumeta—it continuously monitors the market in real time and identifies the best assets to generate trading signals for us!

We have a secure capital protection route, helping us control risk and achieve stable profits!

We have the mindset of a big winner, enabling us to identify the best points to take profit and prepare for the next, even better entry opportunity!

Currency surfing is not our only investment strategy, but on Rate-Cut Liberation Day—it is the one rare, extraordinary opportunity that, if missed, may not come again for ten years! It is like the Super Bowl, held only once a year, miss this season and you

must wait for the next—yet opportunities for wealth show no such patience. Over the past two days, our currency surfing operations have already delivered an impressive report card. The returns have been gratifying—proof that we not only judged the direction correctly but also applied the right methods. Yet don't forget, this is only the prologue. The real drama will unfold on Wednesday—at the moment when the Federal Reserve officially announces the rate cut! Pals, let me emphasize once again: *the potential profit on Wednesday is not 430%, it may break through 700%!* This is no fantasy, but the compounded effect of market sentiment, capital inflows, dollar depreciation, and the surge in demand for safe-haven assets. The mindset of a true big winner is not only knowing when to buy, but knowing when to act! Let us seize the moment together, and in currency surfing win the most exhilarating profits! This opportunity gives us the chance to capture returns and create miracles. Let us ride the wave together and mark Wednesday as our collective day of victory!
