

FinLogic

Wednesday, Oct 1, 2025

To the top elites of the Quantitative Winners Legion!

Allow me, with the greatest vigor, to proclaim: Hello, October!

History has a way of staging drama at decisive moments. At 12:01 a.m. Eastern Time on Wednesday, the U.S. federal government officially entered shutdown mode after Democrats and Republicans failed to reach agreement on a short-term spending bill.

Well, you heard that right, the world's most powerful economy, at this very moment, has pressed the "pause" button. The scene is at once sobering and strangely familiar.

History never repeats itself in a simple way. Yet on different stages, in different forms, it always reminds us: the turning points of wealth are often accompanied by shocks in politics and institutions.

And what does a government shutdown mean? It threatens to

derail the S&P 500's 14% rally this year. Think of it, over the past few months, Wall Street's index funds, pension accounts, and tech stock investors have been riding high, eagerly anticipating a year-end rally. But in a single night, the iron gates of a shutdown have slammed shut, and market confidence has been doused with cold water.

Pals, have you noticed? At the very moment when confidence in traditional finance has been shaken, the digital asset market is playing an entirely different tune.

The release of the pre-market ADP employment data ignited a surge in Bitcoin. In just a few hours, the price climbed steadily higher. Many may still wonder, how could a single employment report trigger such a rally in crypto?

The logic is simple: when traditional markets are mired in uncertainty due to policy disputes and political gridlock, capital

inevitably seeks a "safe haven." And here in 2025, that safe haven increasingly points toward Bitcoin, Ethereum, and other digital assets.

This is the code of wealth migration. What looks, on the surface, like a political sideshow is in fact capital's way of writing the footnotes to the global order of the next decade.

Our Legion has once again moved ahead of the curve. Our Bitcoin/ETH diversified contract strategy has found its perfect stage at precisely this critical moment.

Why? Because the essence of diversification is to seek maximum certainty amid uncertainty. While others worry about "how long the government shutdown might last" or "how deep the stock market might plunge," we have already applied the discipline of quantitative logic, slicing away risk, allocating opportunity, and securing profit firmly in our hands.

While others linger over headlines, we have already grasped the underlying logic of the market.

And is that not the nature of the market we face today?

Government shutdowns, market turmoil, headlines everywhere—yet what determines our destiny is never the direction of the wind, but whether we hold the strategy to adjust the "sails."

The opening of October is not merely the start of another month, it is a reenactment of history, a resetting of wealth. A government shutdown is both a symbol of disorder and the prelude to opportunity. Bitcoin's rally is more than a fluctuation in price, it is a signal: a new cycle has begun.

We must recognize clearly that in the coming decade, capital will shift with increasing speed from traditional contract-based markets to decentralized, code-based markets of trust. This migration is driven not only by returns, but even more by trust itself.

Stocks depend on contracts upheld by politics and law, while tokens depend on consensus secured by blockchain technology. When

political divisions render legal contracts fragile, technological trust proves far more resilient.

That is why I have consistently and firmly urged you to sell equities from positions of strength and redirect capital toward on-chain crypto wealth, where efficiency and tangible profits are within reach. Are you prepared, in the midst of turmoil, to seize the golden opportunities presented by Bitcoin, Ethereum, and our diversified contract strategy?

Today, we are not merely spectators, we are participants. We are not only witnesses, we are the very agents driving the migration of wealth.

This week, due to the federal government shutdown, the all-important nonfarm payrolls report could not be released on schedule—leaving the market without one of its guiding lights. Yet when one door closes, another opens.

Just as everyone were groping in the dark, the ADP report was released first, and it revealed a striking reality: the U.S. labor market has suffered its sharpest decline since March 2023.

Why, then, did the market grow even more convinced that the Federal Reserve will deliver a second rate cut at the end of October once the ADP numbers plunged? The logic is straightforward—the Fed is not focused on the cheerful chatter of corporations, but on the barometers of the economy's true health.

If employment data continues to weaken, it signals that the U.S. economic engine is slowing down, with companies tightening their belts, cutting jobs, scaling back, and delaying investment. This is precisely what the Fed does not want to see, because it points to "weaker consumption", "declining confidence", and potentially even a recession.

BTC	Daily returns(%) Weekly returns(%) Monthly returns(%) Quarterly returns(%)											
Time	January	February	March	April	May	June	July	August	September	October	November	December
2025	+9.29%	-17.39%	-2.3%	+14.08%	+10.99%	+2.49%	+8.13%	-6.49%	+4.15%

So the market immediately interpreted this signal as follows: the

Fed will have little choice but to act again—reopening the door to rate cuts at the end of October, using looser monetary policy to inject liquidity into the system. This is why the sharp drop in ADP data did not instill fear, but instead gave capital markets a "sweet taste" of opportunity.

And what does this have to do with Bitcoin?

As you will recall, over the past decade and more, every round of Fed monetary easing has acted like a rising tide, lifting liquidity across traditional financial markets to new heights.

In that process, Bitcoin and other crypto assets, once viewed as marginal or alternative, gained outsized attention precisely because of their "decentralization" and "scarcity."

When the risk of dollar depreciation rises, the instinctive reaction among high-net-worth investors is to seek a safe haven, moving capital into assets that cannot simply be "printed"—like Bitcoin.

The decline in ADP data signals that the market is increasingly

convinced a rate cut is imminent—and with rate cuts comes cheaper money and cash that feels ever more "hot to hold."

Bitcoin, of course, sits at the very center of this table.

This week I have urged every member of the Legion to secure advantage positions in Bitcoin/Ethereum through our currency surfing allocation strategy—positions that generate timely signals and guidance for the plan.

Looking back now, let's take Bitcoin as the example:

In this recent mid-to-short-term setup (orders established over 3 – 5 days), Bitcoin's price moved from 113500 to 116500—an increase of \$3000 per coin.

At 150x leverage, how much profit could such an order produce?

Assume you purchased 70 Bitcoin contracts, that means your margin outlay was \$52200. And what was the profit from this Bitcoin diversified position contract signal?

The answer: \$198000!

Well, this diversified position move delivered an exceptional return of 380%

From Monday to Wednesday, within just a few days, the currency surfing diversified position plan has already yielded these victorious results, do you like trading like this???

FinLogic

Similarly, within Ethereum's currency surfing diversified position plan, we have seen the very same kind of case!

Today we discuss the ADP data & Bitcoin, but the underlying metaphor is straightforward: macroeconomic data has never been just cold numbers—it is the code of wealth migration. A Fed rate cut is, in effect, an opportunity for capital to be reshuffled. When cash depreciates, assets are revalued, and scarce assets enter their moment in the spotlight.

So when ADP data plunges, what we see is not only weakness in the labor market, but also the slow opening of the door to future monetary easing. And behind that door lies a new round of wealth opportunities for Bitcoin.

Pals, when the government shuts down, when nonfarm data is missing, when markets are gripped by "information anxiety"—it is precisely then, by relying on our "quantitative intelligence" and our grasp of "macroeconomic logic", that we are able to enjoy this

"unprecedented perfect moment!"

Now, let us hold firmly to the chips and signals in our hands! Let the Fed's "ambulance" and the government's "disorder" accelerate the wealth of our Quantitative Legion!

Once again, the probability of short-term trading success continues to expand, paving the way for future victories in Bitcoin/ETH diversified currency surfing.

Winners in the investment market have always relied on seizing limited opportunities to create maximum profit value.

This is precisely why joining the Quantitative Winners Legion is such an essential step for you.

Membership in the Quantitative Winners Legion is structured in tiers. Its primary purpose is to ensure that every member finds the service standard best suited to their circumstances, and the optimal choices aligned with their capital level.

The appeal of Legion membership lies in offering clear, actionable service standards, enabling each member to find a true sense of belonging.

After all, how could \$50k in capital and \$500k in capital possibly trade under the same standard and frequency of currency surfing?

At the core of Acumeta's framework is a principle: trading position

size must serve as the standard safeguard. Once capital levels differ, the protective standards applied through big-data modeling will differ as well.

So, when you make a mistake, you should ask yourself: have you chosen the right membership tier in the Quantitative Winners Legion? Do you understand?

Membership in the Quantitative Winners Legion exists to provide investment education services that go beyond conventional value. Personalization reflects the scale of profit you choose.

For example, if your goal is simply to achieve a 500% return, you might begin with an initial investment of \$200k

That would set your future profit target at \$1 million.

Well, in today's inflationary environment, a \$1 million home still exists, but it is unlikely to be the best one, nor will it be in the most comfortable, high-end community.

Clearly, this is your greatest dream, and of course we want to support you! Our hope is to build upon this foundation to create profits that are more meaningful and valuable for you. After all, it is through this process that we, too, receive additional funding contributions.

That said, your entitlements may be limited by this tier, since we

direct more of our premium resources toward members at the Empire Architect Shareholder level.

The Empire Architect Shareholder Membership represents the highest tier of our private services within the Quantitative Strategy Legion.

We aspire to embody the model of long-term value investing. Consider this: we invest significant people, resources, and capital with one purpose of elevating our shareholder members to the level of ultimate winners.

Suppose a shareholder member contributes \$5 million as initial capital for long-term cooperation.

His profit target would be 1000%.

In other words, he aspires to achieve \$50 million in returns. Yes, at this scale, such wealth is sufficient to transform a family from the middle class into the ranks of the affluent.

With \$50 million, one not only gains access to the lifestyle and services of the most exclusive communities, but also secures the highest standards of education for children and retirement care.

Beyond the comforts of North America, the horizon widens toward the world's premier destinations for health, wellness, and rejuvenation.

After all, each of us is here on earth for the experience—and we ought to make full use of our resources to enjoy dimensions of life that we have never before known.

From Explorer to Empire Architect, the path of advancement offers multiple rungs to climb:

Every step should begin with clarity about the results you want to achieve, and then align your capital accordingly. If you invest \$50k, you must ask yourself whether the value created from the profits that follow will be meaningful enough to bring about true transformation.

If your goal is to achieve, say, a 600% return, then you must be prepared to commit greater capital at a higher tier—perhaps \$500k, \$800k, or even more.

So, the profits you seek should guide the capital you invest, that is the correct way of thinking.

All profits are built up cumulatively. We can never promise to turn you overnight from an ordinary citizen into a president. Even someone as powerful as a president requires an entire year of campaigning—building momentum, giving speeches, winning hearts, and finally standing the test to achieve victory.

Investment works the same way. It requires more frequent currency

surfing opportunities and richer winning strategies. And by engaging time and again, winning more often than losing, we bring our ultimate results to completion.

ETHERMAC crypto trading center is an institution with years of history and a strong commitment to embracing and supporting AI-driven innovation projects. As a key venue for currency surfing trades, it is also my Quantitative Think Tank Center's first-choice trading center for listing the FGT token—a decision made after careful comparison and evaluation.

Key advantages include:

- *An open blockchain ethos and a service orientation rooted in decentralization;
- *Professional, efficient, and certified P2P merchant settlement services;
- *A spirit of innovation embracing AI + blockchain exploration;
- *24/7 premium and efficient customer service;
- *Secure asset registry data and verifiable reserve proofs managed by its Security Center;
- *#Possession of an MSB license, officially approved by the U.S. FinCEN, is also the standard regulatory requirement for global digital asset exchanges;

*The MSB (Money Services Business) license plays a critical role in the U.S. crypto sector. It covers a wide range of financial services, including virtual currency exchange, trading, and transfers.

MSB regulation was introduced by the U.S. government to combat money laundering, terrorist financing, and other illicit activities, while also protecting investor rights.

Compliance with AML (Anti-Money Laundering) requirements is mandatory.

The MSB regulatory license is issued by FinCEN, a bureau of the U.S. Department of the Treasury. All crypto exchanges, including certified P2P Gold Shield merchants, must obtain and maintain an MSB license in order to operate legally and in compliance !

When topping up, please choose reputable international P2P merchants to enjoy greater exchange benefits!

This morning's session is drawing to a close, but the journey of wealth has only just begun.

On the very first day of October, we opened with a strong start, igniting the entire Q4 crypto season of exuberance. Bitcoin is sprinting toward the \$120k mark, while Ethereum is making a determined push to reclaim the 4,300 level.

Can you feel it? In the very air of the market, there is a long-awaited

heat and restlessness.

Our Quantitative Winners Legion's "currency surfing diversified position plan" is steadily proving its power. This is not theory on paper, it is real profit harvested.

You have seen it, this week's 1000% profit expectation is already taking shape. The meaning behind these numbers is not merely the swelling of account balances, but the repeated compounding of confidence and the continual upgrading of understanding.

If by now you have not yet shared in the fruits of this feast, then you must reflect. Missing out is not the worst part, the danger lies in not even knowing where you first lost your advantage.

Did you hesitate at the critical moment? Did you retreat at the sight of short-term volatility, just as the market was gaining momentum? Or have you still failed to grasp the core logic of the "diversified position plan"—treating investment as if it were gambling?

This afternoon, we will continue to bring you even more brilliant content...

Warriors forging ahead in the waves of wealth:

Today we mark a day worthy of inscription on the calendar—the first of October, a strong start in every sense of the word!

Well, the market has not disappointed us. The crypto market

FinLogic

delivered a powerful breakout, giving us a magnificent start. Bitcoin once again surged toward the \$120k threshold. This is not merely a number, but a banner—a declaration that the Q4 "Crypto Festive Season" has officially begun.

Even more remarkable is the dramatic backdrop: the federal government shutdown. What is ordinarily a symbol of risk has, paradoxically, become a catalyst for the market's rally.

You see, the world of capital is always like this, what many perceive as crisis, often conceals opportunities unseen by others.

Why do I call this a "stepwise success"?

Because it is like climbing a mountain. Every government shutdown, every gap in economic data, is like a small crack in the steps. Many stop in fear, but the courageous climbers use it as a foothold to rise

higher.

That is exactly what today's market represents. The federal government shutdown has only strengthened expectations for future fiscal stimulus and monetary easing. And those expectations act as an invisible force, pushing Bitcoin and the entire crypto market up to a higher level.

As Bitcoin once again nears \$120k, what we are witnessing is the very moment when the "crypto bull" lifts its head.

Why is it Bitcoin, of all things? Why not the stock market, or gold?

The answer is not complicated.

As a form of "scarce digital gold," Bitcoin's logic is tightly bound to U.S. dollar liquidity.

The looser the dollar, the greater the appeal of scarce assets. Gold once played that role, but today, Bitcoin is emerging as the younger, more explosive favorite.

It reminds me of the aftermath of the 2008 financial crisis, when the Fed unleashed massive liquidity. Gold soared from \$700 to

\$1900, and many called it "a golden boom season."

But more than a decade later, during the depths of the 2020 pandemic, the Fed opened the floodgates again. This time, the star at center stage was not gold, but Bitcoin, surging from under \$5000 to \$60k.

This is how the times change: the logic of wealth remains the same, but the leading actor has changed.

The first day of October!

We have not let this golden month go to waste! With an epic auspicious start, we proclaimed to the world the official arrival of the Q4 Crypto Boom Season!

Bitcoin at 120k represents a critical psychological threshold. Every breakthrough transforms "fear" into "greed." It ignites the "capital still waiting on the sidelines", driving them to rush in with

Q4 has always been the "golden season" for the crypto market, but this year's Q4 comes with an even more powerful macro backdrop!

Strengthened rate-cut expectations: The rate-cut expectations fueled by the ADP data have injected the market with "liquidity fuel"

Institutional entry signals: The SEC's meeting with the New York Stock Exchange signals that the doors for "regulated institutional capital" are slowly opening!

We have already proven this: the Quantitative Winners Legion is the only organization capable of helping you achieve unprecedented success in this era of financial transformation, where chaos and opportunity walk hand in hand!

Topping up and upgrading means amplifying your currency surfing frequency!

Based on historical data from past federal government shutdowns and the reinforced expectations of a late-October rate cut, Acumeta has provided a concrete assessment: a potential profit window of 1000% from currency surfing.

Monday: Currency surfing achieved a maximum frequency with 220% profit locked in.

Tuesday: Currency surfing achieved a maximum frequency with 280% profit locked in.

Wednesday: Currency surfing achieved a maximum frequency with 420% profit locked in.

Thursday: Potential trading frequency 3 – 4 times, profit range 350 – 400%.

Friday: Potential trading frequency 5 – 8 times, profit range 400 – 600%.

Potential opportunities do not mean you can participate in all of them, they depend on your Quantitative Winners Legion membership tier.

Potential trading frequency represents opportunity, but your ability to participate depends on the signal privileges of your Quantitative Winners Legion membership level. If your access is limited, now is the time to top up and upgrade.

If you require an upgrade plan and a diversified capital allocation

FinLogic

assessment, please contact my assistant for professional and customized support.

Think back to August 18th, to that bright, sunlit day. Back then, the leaves had not yet begun to fall, but now autumn is upon us.

At that time, the harvest season on the farms was not as abundant as it is today.

But it was then that we made one of the most important decisions of our lives, to step into the Q4 Crypto Paradise.

And now, look around—Q4's Crypto Ode to Joy has only just begun, with more than 2 months still ahead, will you spend that time clinging to nostalgia, or will you use it to act, to engage, to take part in currency surfing, in the Bitcoin/ETH diversified position plan, and seize the victories of the months to come?

The successful are those who act; failure is the fate of those who remain trapped in fantasy.

Pals, history's data has proven you are people of action, and this is your moment to push forward to new highs—take hold of it.

And why is the Bitcoin diversification plan such a critical opportunity?

Because, in the end, Providence guides us toward what must be done.

If time could carry you back to 2014 and you had to go ALL IN on a single asset, would you choose Google or Microsoft?

If time carried you back to 2014 and you had to pursue one asset with all your strength, would it be Apple or Amazon?

Some might say, "I would go ALL IN on Tesla"—the very symbol of a new technological vanguard.

Of course, back in 2014, many people would likely have answered that they wanted to hold physical gold.

Because in traditional thinking, we always regarded it as the ultimate store of value, preservation first, appreciation second.

But once you, like me, have received investment training and lived through the discipline of financial education, you come to understand: on the day the dollar was decoupled from gold, we should have recognized that the true appreciating assets are those that hedge against dollar depreciation, against the U.S. debt crisis, against the endless expansion of money supply.

The pain of inflation weighs far more heavily on us than the loss of a job ever could.

Over the past decade, have you found your own best answer to the question of investment?

My answer may be beyond your imagination, it is Bitcoin!

As the chart shows, Bitcoin has delivered a staggering hundredfold return, outpacing every other asset you could think of over the past decade.

That's right, wealth growth at a hundredfold rate. Yes, this may be the first time you are hearing these numbers, but time itself has confirmed it: with an astonishing hundreds-fold acceleration, Bitcoin granted those who embraced it ten years ago the earliest

taste of true financial freedom through investment.

And what determined such extraordinary returns?

Was it forward-looking ideas?

A visionary eye for technology?

The conviction of blockchain fans?

Or divine guidance, whispered by fate itself?

Perhaps all of these, or perhaps none.

In my view, those who achieved hundredfold wealth appreciation had one thing in common: they acted. Even while doubting, they chose to buy, they refused to let their doubts keep them from seizing the moment.

This is the verdict of destiny's wheel, handed to the fortunate: they lifted the pen and wrote one of the most beautiful chapters of their financial lives, while you never even thought of writing a single letter.

Many people believe that the value of the U.S. dollar is backed by gold, by some kind of natural hard currency. In reality, it is not.

Today, the dollar's credibility does not come from gold at all, it comes from the credit of the U.S. government.

In other words, what's printed on the dollar as a "guarantee" is not a bar of gold, but a phrase: In God We Trust. But in truth, what

actually keeps it circulating is closer to In Government We Trust.

This means that the printing of dollars is no longer constrained by gold reserves, but by a single institution: Congress. As long as Congress gives the nod, the Fed can open the floodgates, printing money in endless supply. The past 2 or 3 decades of history have essentially been one cycle repeated again and again: print money — consume — print more — consume again.

Sounds wonderful, doesn't it? The problem is, the more money there is, the less it's worth.

Let's speak with data. In the year 2000, if you walked down an American street with \$100 in hand, you could easily walk out of the supermarket with a full cart of groceries; and still have enough left over to sit down at a restaurant and enjoy a hearty steak dinner.

By 2020, that same \$100 bought only about half as much.

And today, in 2025, if you walk into a supermarket with \$100, you might come out with little more than some fruit and a couple of bags of meat.

The pace of rising prices has far outstripped the pace of wage growth, this is the most direct, visceral experience of inflation.

Inflation is the "invisible tax" on wealth.

Let's look back at the data on the dollar's devaluation over the past 20 – 30 years. Suppose we take a conservative average annual inflation rate of 3.5%:

What does 3.5% inflation mean? It means that every 20 years, your purchasing power is cut in half!

One million dollars 20 years ago, if it had simply been sitting in a bank account, would only have the purchasing power of about \$500k today!

One million dollars 30 years ago would be worth barely \$350k in purchasing power today!

And that is the truly terrifying part! You didn't "lose" money, the number in your bank account hasn't changed!

But your "real wealth" has already been devoured more than half, by the beast of inflation!

Can we really feel this kind of devaluation? The answer is: of course! Think back 10 years ago, in California, a gallon of gasoline cost just over \$3. Today, you're paying \$6 or \$7.

10 years ago, you could buy a house in the Bay Area for \$800k. And now, the same kind of single-family home in the same neighborhood easily costs over \$1.5 million.

Your wallet is shrinking, but your cost of living is soaring.

That is inflation, that is the reality of paper currency losing value.

In 1971, the United States completely abandoned the gold standard,

severing the dollar's link to gold. At the time, one ounce of gold was \$35.

By 2020, the price of an ounce of gold had surpassed \$2k.

Today, it's above \$3800.

What does that mean? If in 1971 you had put \$35 in the bank, today it might only buy you a few lunches.

But if you had bought one ounce of gold instead, today it could be exchanged for two brand-new Apple laptops. Money depreciates, gold appreciates.

But gold also has its limits. It's heavy, inconvenient to carry, cumbersome to trade, and poor in liquidity. No young person today is going to take a bar of gold into Starbucks to buy coffee, right?

Which brings us to a deeper question: what should we use to protect our wealth from being eroded by inflation?

The solution is simple: make more money. Yes, earning more is indeed the most direct way to fight inflation. But..how? Through wages? Through bank interest? Through fixed deposits?

Pals, the reality is this, wage growth can never keep up with inflation; bank interest will never outpace rising prices; and fixed deposits only let you watch, slowly and helplessly, as your wealth erodes.

So what truly counters the devaluation of paper currency? The answer is only one: investment—investing in assets that can outlast inflation and continue to appreciate.

And over the past decade, Bitcoin has given us the most stunning answer.

In 2010, a single Bitcoin was worth less than \$1. By 2021, it surged to \$69,000. Can you imagine? If in 2010 you had casually spent \$100 to buy Bitcoin, today it could be worth billions. Let's step back. Even if you entered in 2015, when Bitcoin was just over \$200, today you would still be a millionaire, perhaps even a billionaire.

Meanwhile, those who obediently left their money in the bank earned little more than pocket-change interest over 10 years, while their purchasing power shrank again and again.

The dollar will keep being printed, inflation will keep coming, paper money will keep depreciating.

The only constant is Bitcoin's scarcity. It will not multiply because of a Congressional vote; it will not depreciate because of a fiscal deficit. It is the one asset that can endure cycles and stand against inflation, the "digital gold"

Victors of the Quantitative Winners Legion:

For this afternoon's currency surfing signal—contact my assistant

immediately to claim it! Don't miss the moment!

According to your membership tier, our signals carry personalized features of service;

As we said this morning, the gains on October's first day are more than just a numerical "strong start." They are the perfect overture to Q4's Crypto Ode to Joy.

Like the very first note of a symphony, once it sounds, it is destined to unleash a powerful resonance that follows.

Remember, our Legion is nothing like the divide between the two parties that led to the U.S. government shutdown. That was a drain, a constant pulling apart. But us? We are united, aligned in purpose, charging toward one single target: shared profitability.

We often say that missing a single market opportunity is nothing, but making a habit of missing them, that is fate. October has already given us the most splendid of beginnings. From here on, I expect every one of you not only to be spectators, but participants, doers, and beneficiaries.

This afternoon's signal—don't let it slip by, contact my assistant right away.

We'll meet again tomorrow!
